Finsbury, E.C.1. Assistant Medical Officer of Health

Rationed Distribution of Doctors?

SIR,—To meet what is now an urgent need and which will become a paramount need of the Services for doctors, I have severely practical proposals to make. We have had at least a partial rationalization of industry to meet war needs, but no attempt at a co-ordinated plan has been made to obtain maximum efficiency for medical services by the same process. Apart from the obvious waste of skill which this lack of organization entails, injustices result, of which inequality in loss of income is only one. It is not at all impossible to estimate the basic needs in medical personnel per unit of the civilian population; numbers must be reduced to basic needs and therefore all "frills" must be abandoned. One assumes that the demands of the Services are inescapable, and that there is no waste by them of personnel either at home or abroad.

For a 50,000 unit of urban population, I estimate basic needs as: general practitioners 10; public health staff 4 (including one fever hospital resident); surgeons 4; house-surgeons 2 or 3;

anaesthetist 1; obstetrician-gynaecologist 1; obstetrical house-surgeon or R.M.O. 1; specialist physicians (no house-physicians) 2; pathologist 1; radiology and ophthalmology, equivalent of 1 specialist. Rural population would require about 30% more general practitioners and 20% more public health staff. Only able-bodied men and women under the age of 70 should be included.

The necessary adjustments to make such a service feasible would be: (1) Complete pooling of practices; immediate establishment of central clinics or health centres, with elected director, roster of services, off-duty time, etc. (2) Taxation or levy for health services on the whole population to meet the costs of medical service in wartime; no individual fees; salary for the duration of the war for all doctors on a scale proportionate to service offered plus a factor for age and family obligations. (3) Domiciliary work reduced to an essential minimum. (4) Suspension of school clinics and infant centres (but full maintenance of school and health visitor staff). (5) Compulsory service for all doctors of both sexes under 65; no exemption for married women without young children. (6) Hospital resident posts, apart from limited number of specialist training posts, reduced to a 3-months period.

I take my own immediate area, mostly urban, with a population of about 30,000, as an example. There are practising in this area 12 general practitioners, 4 public health staff, 3 surgeons, 1 obstetrician-gynaecologist, 1 specialist physician, 2 pathologists, half-time anaesthetists to the equivalent of 1 specialist, 1 part-time radiologist, 5 hospital residents—total 29, or nearly 1 per 1,000 of the population. Some of the specialists give part-time service to the neighbouring E.M.S. hospital, but this is not such an important factor as to upset the calculation. On the basis outlined, this area would now release for service 1 surgeon, possibly a second surgeon or 1 physician specialist, 1 pathologist, 1 public health officer, 3 or possibly 4 general practitioners, 2 hospital residents. I am an ardent advocate of immensely increased health services, but this great reform must wait until the world is secure from savagery. We shall then expect to have a large reserve of doctors, not enough but still substantial, to inaugurate the new health era.—I am, etc.,

Inverness. D. LEYS.

Sedimentation Rate

SIR,—It is with a growing feeling of impatience and dissatisfaction that I have read the recent articles and correspondence on the subject of blood sedimentation. It appears to me that the medical profession has adopted this test in complete ignorance of the principles involved. An engineer can make use of his knowledge of sedimentation in rivers to good purpose, and he is working on accurate and scientific methods, which he fully understands. Compare this with the sedimentation of biconcave disks in a sticky solution, and consider the enormous number of variable factors involved. It would appear that medical men are using this test to justify the clinical condition of a patient, when they would be better employed in practising and perfecting their powers of clinical observation, for which they have been trained.

If any medical practitioner is under the impression that he understands the subject, he would be wise to read the recent researches of R. B. Whittington in the *London, Edinburgh, and Dublin Philosophical Magazine*, Jan., 1942; *British Journal of Experimental Pathology*, Feb., 1942; *Tubercle*, Sept., 1942; *Lancet*, Oct. 31, 1942; and *Proceedings of the Royal Society*, 13, Nov., 1942. Progress has been made in the fundamental study of red-cell sedimentation in these studies.

No one would doubt the value of accurate and reasonable investigation in haematology and blood chemistry, but our attitude to blood sedimentation is unscientific and unhealthy. If, as is now suggested, blood sedimentation is to be conducted in moving vehicles the matter is becoming ludicrous. If the oracular predictions are as reliable as ever under such conditions, medicine can no longer be considered an art or even an inexact science, but a magic cult. I feel sure that there are many engineers at present, with sufficient spare time, who would be only too pleased to investigate the effects produced by size of car, road surface, tension on springs, tyre pressure, etc. Perhaps they could advise us regarding the adjustment of our shock-absorbers, and find a formula suitable to make corrections, in case we use the Austin 7 or Rolls 40.

Perhaps I am prejudiced in my desire to preserve scientific accuracy and to understand the tests I employ. At any rate I have abandoned the use of blood sedimentation tests long ago, and it will require reason to make me readopt them. The only value I have ever found from the fashion was that it tended to inhibit the indiscriminate use of gold in the treatment of arthritis, since we were carefully informed that this remedy was unsafe without blood sedimentation control.—I am, etc.,

Blackpool, Lancs. F. M. HILLIARD, M.D., F.R.C.P.I.

⁂ This correspondence is now closed.—ED., *B.M.J.*

Working for a Salary

SIR,—Few would deny that the activities of certain medical research workers on a fixed salary have been the means of great relief to suffering humanity, but this does not mean that the issue between a system of fixed salaries and one of competitive incomes has been decided in favour of the former. Many other points besides isolated acts of brilliant accomplishment must be considered before the question is settled. One such point is that research workers, for the most part, are servants of institutions, and that institutions are in the habit of paying their servants fixed salaries. In other words, these men, in common with medical officers of health and officers of civil and military medical services, are chiefly engaged in serving the interests of institutions or organizations, not directly of individuals, and consequently if they are to be paid at all it will be in the manner customary to institutions and organizations.

In contrast with the status of the medical officer consider that of the general practitioner. He serves not institutions but individuals. Here there is an arrangement of mutual advantage between two persons. In return for service rendered the patient transfers to the doctor a whole- or part-claim on goods or services which the latter needs then or may need at some future time. The relation of patient to doctor is that of master to servant. This position is not in any way derogatory to the doctor. "Whosoever would be first among you shall be servant of all." An honest servant will not ask for more than is just, and a great service deserves, though it may not always receive, a corresponding reward.

In general it is true to say that we can each choose one of two masters—the institution or the individual. It does not help matters to denounce one or the other. Each has points in its favour. The institution is an essential part of every civilized society. Fortunately for humanity the necessary institutions appear to obtain, voluntarily or otherwise, enough servants to meet their needs. We G.P.s who serve the individual find him trying at times, but in our heart of hearts, in spite of such blandishments as a fixed and adequate salary, pension, paid holidays, etc., I don't think a majority of us wish to change.—I am, etc.,

Bexley, Kent. E. U. MACWILLIAM.

Health Centres and Periodic Medical Examination

SIR,—In the leading article on planning and the M.O.H. (Nov. 14, p. 580) I think you come to the crux of the whole matter in your statement: "Clearly the medical profession will need a new kind of education before really effective progress can be made." There can be no fusion of the public health and the general practitioner services until the function of the doctor is revisualized and made comprehensive to embrace preventive and curative medicine.

I do not think that health centres as at present suggested are a practical proposition. This innovation will require to be built up step by step, and in its introductory stage a health centre can be fully occupied with preventive measures.

I fail to find in the suggestions for replanning one of the most important means of keeping the individual healthy, and that is periodic medical examinations. The principle is carried out in the school medical service and partly in the child welfare service. The National Health Insurance service will need to be reorganized to meet this requirement. I suggest, therefore, that the health centre should be the place for carrying out this most important duty. All doctors should be engaged on this work. Medical boards formed by doctors in rota should be set up for this purpose. A team of specialists should be available to deal with any conditions requiring their attention. A report drawn up by the board should then be sent to the family doctor in each case. Such information will be most valuable to him and will relieve him of essential work which can be done more expertly by the board.

If the whole family is to come under the National Health Insurance system there should be no difficulty in making these board examinations a condition of enrolment in the service. In addition, there is medical inspection for life insurance, medical inspection for the Services (civil and military), the factory service, and so on. The advantages of such initial expert medical inspection are obvious. It supplies the family doctor with the classification of the patient and gives the patient interest in his own health. The subsequent care of each person should be in the hands of the family practitioner, who should have the opportunity of referring a particular case to the board as he considers advisable. From this initial duty of a health centre other spheres will develop in its organization, but I firmly consider the total functions of the health centre should grow up round this preventive work.—I am, etc.,

S. P. BEGGS, M.D., D.P.H.,
Morecambe and Heysham. M O H Middleton (1921-41).

The Services

The D.S.O. has been awarded to Capt. S. B. Thompson, N.Z.M.C., and the M.C. to Capts. R. D. I. Beggs and R. P. Lawson, R.A.M.C., in recognition of gallant and distinguished services in the Middle East.

Temp. Acting Surg. Lieut.-Cmdr. A. D. Bateman, R.N.V.R., has been appointed O.B.E. (Military Division) for coolness and devotion to duty during an enemy air attack.

Temp. Surg. Lieut. S. Moss, R.N.V.R., has been mentioned in dispatches for skill and endurance.

Temp. Surg. Lieut. R. C. R. Gethen, R.N.V.R., has received a commendation for bravery in an enemy air attack.

The King has approved the award of the George Medal to Flying Officer J. A. Elliott, R.A.F.V.R. The citation in the *London Gazette* dated Dec. 1 reads as follows:

> "In May, 1942, a Boston aircraft crashed shortly after taking off from an aerodrome and burst into flames. An airman who was on duty near by hastened to the scene, where he was joined by 5 soldiers. Although the fire was intense and ammunition was exploding in all directions one member of the crew (the air gunner, who was seen to be hanging out of the turret) was dragged from the wreckage by one of the soldiers and then, with the assistance of the remainder of the party, carried on a stretcher to an ambulance which had arrived. The party was returning to the aircraft, which was then being approached by the station engineer officer and F/O Elliott, a medical officer, when a bomb exploded. The engineer officer was thrown to the ground bleeding from the chest. F/O Elliott, although also knocked down, was uninjured and immediately went to the aid of the engineer officer. He gave him morphine, and at the time was fully aware that other bombs were in the aircraft only 8 yards away. A second bomb exploded, which wounded F/O Elliott, but he valiantly attempted to remove his injured comrade. Eventually F/O Elliott was assisted away by one of the soldiers, whilst the remaining men of the party removed the engineer officer, who was found to be dead. Throughout F/O Elliott displayed great determination and complete disregard for his own safety."

CASUALTIES IN THE MEDICAL SERVICES

Surg. Lieut.-Cmdr. DAVID SIMPSON, R.N., who was killed on active service last month, was educated at the University of Liverpool, where he graduated M.B., Ch.B. in 1933. Entering the Royal Navy as surg. lieut. in the following year he was promoted surg. lieut.-cmdr. in 1940. He leaves a widow, a member of Queen Alexandra's Royal Naval Nursing Service Reserve. He was a member of the B.M.A.

Surg. Lieut.-Cmdr. NORMAN ALFRED VERNON, R.N.V.R., is reported "missing, presumed killed" in action in November. He was the elder son of Mr. and Mrs. G. Vernon of East Sheen, and received his professional education at St. Thomas's Hospital, qualifying M.R.C.S., L.R.C.P. in 1931. After holding the post of resident medical officer at Worthing Hospital he settled in practice at Petts Wood in Kent and later at Chislehurst, where he was police surgeon. He entered the R.N.V.R. in 1935 and was promoted surg. lieut.-cmdr. in 1940. He leaves a widow.

War Subs. Capt. GEORGE NOEL BRAHAM, O.B.E., M.C., R.A.M.C., died at Baghdad on Nov. 16. Born at Bath on June 24, 1886, he was educated at Manchester and took the Scottish triple qualification in 1909 and the F.R.C.S.Ed. four years later. He held house posts at Ancoats Hospital and Monsall Isolation Hospital before moving to Southampton, where he became senior house-surgeon at the Royal South Hants and Southampton Hospital. In the war of 1914–18 he served in the R.A.M.C., attaining the rank of capt., and was awarded the M.C. for "conspicuous gallantry and devotion to duty. He with four others worked continuously under intense fire and succeeded in rescuing several wounded men from an advanced dressing station, which was untenable. He set a fine example of courage and determination throughout." After demobilization he took the post of medical officer at the Civil Hospital, Baghdad, and later became librarian to the Baghdad Medical Society. He was appointed O.B.E. in 1921 for services in Mesopotamia. In 1923 he took the post of Civil Surgeon, Baghdad, and also became senior surgeon to the Royal Hospital in that city and chief surgical specialist to the Iraqi Health Services. In addition he was deputy senior medical officer to the Anglo-Persian Oil Company, becoming the company's consulting surgeon when he moved to Masjid-i-Sulaiman in Persia in 1928. In 1924 the King of the Hedjaz conferred upon him the Order of El Nahdi (Third Class) in recognition of valuable services rendered. Mr. Braham returned to England in 1929 and settled in practice at Gosport, where he became honorary medical officer to the local memorial hospital. In 1936 he again went to Baghdad, this time to take up the positions of professor of surgery in the Royal Medical College and head of the surgical unit in the Royal Hospital. He was elected president of the Mesopotamia Branch of the B.M.A. in 1938. Early in 1941 he re-entered the R.A.M.C. as temp. lieut. and was in Lebanon when the Allies entered the country to remove the threat of Axis domination. His contributions to medical literature included four articles in this *Journal*.

Lieut.-Col. WILLIAM PEET HOGG, M.C., I.M.S., died at Poona on Nov. 5. He was born on Feb. 29, 1888, and was educated at the University of Aberdeen, where he graduated M.B., Ch.B. in 1912. He also took the D.T.M.&H. of the London Colleges in 1920. He entered the R.A.M.C. in Oct., 1914, becoming capt. a year later. In 1916 he was appointed capt. in the I.M.S. and became lieut.-col. in 1934. He served in the war of 1914-18, in Iraq 1917-19, was mentioned in dispatches, and was awarded the M.C. and bar. Most of his Indian service was spent in the Political Department, where he was surgeon to the Mewar Agency, Rajputana, and superintendent of hospitals and gaols in that agency and later chief medical officer and inspector-general of prisons, Baluchistan. He had been a member of the B.M.A. since 1923.

Lieut.-Col. SUKUMAR NAG, I.M.S., who is included as "died" in an India Office Casualty List published on Nov. 26, was born on Nov. 13, 1890, and was educated at the University of Calcutta, where he graduated M.B. in 1915. He also took the F.R.C.S.Ed. and the D.T.M.&H. of the English Royal Colleges in 1924. Entering the I.M.S. in 1920 he became lieut.-col. in 1935.

Wounded.—Capt. R. D. I. Beggs, R.A.M.C., War Subs. Capt. P. T. Savage, R.A.M.C.
Missing.—Capt. C. R. Robson, R.A.M.C.

Obituary

We regret to announce the sudden death of Dr. MARY JANET PIRRET of West Cromwell Road, S.W., who had been a member of the B.M.A. from the time of graduation. She was born in Glasgow on June 2, 1878, daughter of the Rev. David Pirret, and from Hillhead High School went to study medicine at Queen Margaret College, Glasgow. She graduated M.B., Ch.B. of Glasgow University in 1901, M.D. in 1906, and took the Cambridge D.P.H. in 1911. Dr. Pirret's first house appointment was at the Mater Infirmorum Hospital, Belfast; she was then in turn house-surgeon to the Clapham Maternity Hospital and to the Chorlton Dispensary, Manchester, and assistant M.O. at the Crichton Royal Institution, Dumfries. In 1911 she was appointed school medical officer for the county of Wigtown. She came to London to undertake part-time public health work under the L.C.C., and had been M.O. for maternity and child welfare for the borough of St. Pancras.

Dr. ANDREW STEWART TINDAL, who died on Nov. 22 at his home in Newlands Road, aged 75, was one of the best-known practitioners in the south side of Glasgow. He graduated M.B., C.M. of Glasgow University in 1889, proceeded M.D. in 1892, and was elected a Fellow of the Royal Faculty of Physicians and Surgeons of Glasgow in 1905. After holding house appointments he joined his father in general practice, and later became senior partner of the firm. Dr. Tindal was at one time an assistant physician on the staff of the Victoria Infirmary, visiting anaesthetist to the Western Infirmary, the Royal Hospital for Sick Children, and the Glasgow Dental Hospital, and had been assistant physician to the Belvidere Fever Hospital. He joined the British Medical Association in 1892.

Dr. **FREDERICK WILLIAM STEWART**, who had been a member of the B.M.A. for nearly 40 years, died on Nov. 29 at Beckenham, where he had long practised. He was born at Ballymena, Co. Antrim, in April, 1878, and had a distinguished career as a medical student at Queen's College, Belfast, before the University received its Charter. He graduated B.A. of the old Royal University of Ireland in 1899, M.B., Ch.B., B.A.O. in 1902, and M.D. in 1906. After holding demonstratorships at Queen's he was for a few years in the mental hospital service in Kent, and then settled in practice at Beckenham, where he filled a number of public appointments. During the last war he served with a temporary commission in the R.A.M.C. as mental specialist to the 50th General Hospital, B.E.F. In 1907 he published jointly with Sir Frederick Mott a paper on chronic lead encephalitis.

Dr. **WALTER CARR** (writes Dr. Marion S. Linton), whose death was recently reported in this *Journal*, was a great teacher. As medical tutor to the women students at the Royal Free Hospital he taught us, with reiterated patience and great thoroughness, that in clinical medicine first things were first. We were a little afraid of him—his comments were caustic—but, at a time when medical women were still "on sufferance," he gave us of his best, and there must be many of my day and generation to share the feeling of deep gratitude, respect, and affection for all he did for us.

We regret to announce the death of Dr. **JOHN M. T. FINNEY**, sen., professor of clinical surgery at Johns Hopkins University and honorary Fellow of the Royal College of Surgeons of England, aged 78.

According to a Reuter message Prof. **ALBERT DUSTIN**, formerly Rector and Dean of the Faculty of Medicine at the University of Brussels, has died at the age of 58.

Medical Notes in Parliament

Venereal Disease

Mr. **BROWN** stated on Nov. 19 that the Ministry of Health had already received much help from the Press and the B.B.C. in the publicity campaign on venereal diseases. He was asking the responsible local authorities to make more extensive use of the services of the Central Council for Health Education, which included pamphlets, films, and lectures, and to advertise local facilities for treatment by the wider exhibition of posters and otherwise. The campaign's development and success depended largely on the extent to which the Press and other leaders of public opinion, including M.P.s, gave it active and continued support.

On Nov. 24 Mr. **BOOTHBY** asked the Minister of Health whether his attention had been drawn to the serious increase of venereal disease in this country and to the inadequate measures so far taken to combat it; and whether he would give immediate directions to the Departments concerned to neglect no step to encourage the use of every kind of preventive measure and to stop the spread of infection. Miss **HORSBRUGH** said the increase of venereal disease had been receiving the close attention of the Minister of Health in consultation with the Secretary of State for Scotland. A Defence Regulation for combating this problem had been laid before the House. Mr. **BOOTHBY** asked if Miss Horsbrugh was aware that this Defence Regulation was quite inadequate to combat this problem. Was it the intention of the Government to initiate a propaganda campaign throughout the country? Miss **HORSBRUGH** referred to a previous reply on Nov. 19, which stated what publicity and further educational remedies were to be undertaken. Dr. **SUMMERSKILL** asked if the Department had considered compulsory notification, which was a course advocated by many medical authorities. Miss **HORSBRUGH** said that the Department had considered many schemes, and the scheme now before the House in this regulation was that for which it was thought desirable to get sanction from the House. Mr. **BOOTHBY** said he would raise the matter on the motion for the adjournment at an early opportunity.

Diphtheria Immunization: Publicity

Sir **FRANCIS FREMANTLE** on Nov. 19 invited Mr. Brown to arrange for simple leaflets and advice on diphtheria immunization to be given by registrars of births and by maternity and child welfare officers to all parents attending their offices and clinics. Mr. **BROWN** replied that mothers attending welfare centres had for some time been urged to have their children immunized against diphtheria. He had recently asked that health visitors should be taken off less urgent routine duties to give similar advice in the homes. On the suggestion that registrars of births should be asked to advise parents in this sense, Mr. Brown commented that as most medical authorities regarded the first birthday as the best time to immunize a child he doubted whether this method would be effective.

Small-pox in Edinburgh

Mr. **JOHNSTON**, replying to Mr. Viant on Nov. 24, said that 24 confirmed cases of small-pox were associated with the Edinburgh outbreak, and one other case was in hospital under observation. Nineteen cases were or had recently been patients in a medical institution or an associated convalescent home, three were medical students attending at the institution, and two were contacts of the original cases. In the remaining case no connexion with the institution had so far been traced. Four of the patients had died.

Rehabilitation after Loss of Limbs

Miss **WARD** on Nov. 24 asked what were the arrangements for the rehabilitation of Service men and civilians who lost limbs as a result of war service or enemy action. Sir **WALTER WOMERSLEY** replied that after active stump treatment had been completed and the artificial limb supplied, the patient was taught how to make the best use of his artificial limb. During this period of instruction, which varied from case to case, the man or woman might be either an in-patient or an out-patient of one of the Ministry's hospitals. Often, particularly in the case of arm amputations, the individual preferred to be an out-patient and live at home. Where this did not interfere with his treatment, he did not feel justified in compelling him to become an in-patient. In addition, while the patient was under hospital treatment, officers of the Ministry of Labour discussed with him and the surgeon-in-charge the question of future employment. Where required, vocational training was given, and, in the case of arm amputations, his Department provided any appliances necessary for the trade or calling which the patient intended to pursue. Virtually all amputation cases of the present war, whose treatment had been completed, were either in full employment or would be on the completion of their vocational training.

The Minister also said that he was considering whether civilians who become totally disabled as a result of war service or enemy action should be eligible for a constant attendance allowance in cases of helplessness in addition to the war pension.

Accidents and Sickness in Miners

Major **LLOYD GEORGE**, replying on Nov. 24 to Mr. Gallacher, who asked why no report had been issued by the Chief Inspector of Mines in view of the high accident and sickness rate among miners and the effect this was having on production, said that a general decision had been taken to suspend for the time being the issue of departmental reports not immediately essential to the war effort. Information and statistics relating to accidents in mines had, however, been given from time to time to the House and elsewhere. In addition, in each year since the war, the divisional inspectors of mines had circulated to collieries in their respective divisions details of accidents during the previous year, together with suggested means for effecting improvement. The figures for the present year were considerably lower than those for the corresponding period of 1941.

In reply to Mr. J. Griffiths the Minister said that 1,827 persons in the South Wales coal mines were certified in 1938 by examining surgeons in respect of scheduled industrial diseases. The figures of persons injured (disabled for more than three days) by accidents at mines under the Coal Mines Act in the South Wales and Monmouth coal fields during 1938 were:—Fractures: thigh (femur), 33; leg (tibia or fibula), 267; arm and forearm, 85; spine, 30; pelvis, 27. Injuries and/or other fractures: head, 1,789; arm, 1,959; hand, 8,302; thigh or leg, 4,060; foot, 3,272; eye, 703; back, 2,165; other parts of body, 2,146. Total, 24,838.

Doctors for Appeal Tribunals

Sir **WALTER WOMERSLEY** on Nov. 26 assured Sir Francis Fremantle that the Central Medical War Committee was consulted by the Medical Personnel (Priority) Committee when the latter body was asked to consider the availability of medical men for Pensions Appeal Tribunals. He himself had consulted the Medical Personnel (Priority) Committee on Oct. 24, 1941. The Secretary of the B.M.A. was formally consulted in the matter, in his capacity as Secretary of the Central Medical War Committee, in regard to the medical requirements for the staffing of Pensions Appeal Tribunals.

Sir **Francis Fremantle** reported that the British Medical Association said it had received no formal request for the provision of medical men. Sir **Walter** said the Ministry of Pensions was always applying and the answer had been that the personnel was not available. He kept in touch with the Service Departments, and in the case of every medical man who was discharged from them he considered whether he would be suitable. He had advertised in the medical press. The replies showed the difficult position in which he was. He was willing to receive applications from anyone or to consult anyone.

Tuberculosis Mortality

Mr. **Brown** stated on Nov. 26 that the numbers of deaths from tuberculosis (all forms) in London and in the remainder of England and Wales during certain years were as follows—the figures being inclusive of deaths of non-civilians before the outbreak of war and exclusive thereafter:

	London	Remainder
1938	2,861	22,634
1939	2,875	22,722
1940	3,005	24,866
1941	2,895	25,378

The corresponding death rates per 1,000,000 population in 1938 and 1939 were 704 and 760 in London and 609 and 606 in the remainder of England and Wales. For 1940 and 1941 comparable rates were not available on account of the heavy evacuation of London residents which attended the outbreak of war. Considerable numbers of London residents who were then in institutions outside London and died there during 1940 and 1941 would continue to count as London deaths, while a large proportion of the population had been transferred and credited to areas outside London. Rates obtained by relating such deaths and populations would be entirely misleading.

Diphtheria Immunization.—On Nov. 10 Mr. **Alfred Edwards** asked the Minister of Health whether he was aware that a pamphlet recently circulated to all members of the House of Commons charges the Ministry with misrepresentation and evasiveness in its claims for diphtheria immunization, and if he would appoint an impartial committee to examine those allegations. Mr. **Ernest Brown** said he had seen the pamphlet. The case for immunization against diphtheria was fully supported by medical opinion and practical experience in other countries, and as advocacy of immunization had been the Government's considered policy for some time past he did not think there would be any advantage in appointing a committee.

Pasteurization of Milk.—On Nov. 17 Mr. **Ernest Brown** informed Col. Carver that the Minister of Food, with whom he was in close consultation on the subject, was taking all practicable steps to extend pasteurization of milk. They were also consulting on the best allocation among children of the supplies of dried milk available.

Lung Disease in Coal Miners.—On Nov. 17 Sir **William Jenkins** asked the Home Secretary what action he had taken to implement the report of the Medical Research Council into lung diseases among coal miners in South Wales; if he was aware that the disease was on the increase; and if he would take steps forthwith, as the matter was vital for the mining industry. Mr. **Herbert Morrison** said that the Minister of Fuel and Power and he were fully alive to the urgency of this matter, and were anxious to deal with it at the earliest date possible. Consultations with a view to securing agreement had been in progress with the representative bodies concerned, but were not yet complete.

Surgical Belts as Rationed Clothing.—On Nov. 17 Sir **William Davidson** asked the President of the Board of Trade whether he was aware that surgical abdominal belts had recently been included in the clothes rationing scheme, thereby involving hardship to people who were obliged to wear such appliances; and whether he would consider the exclusion of surgical belts from the clothes rationing scheme on the production of a medical certificate. Mr. **Dalton** said that most kinds of surgical abdominal belts had been included in the clothes rationing scheme from the beginning But, in view of the serious shortage of rubber, steel, and other materials used in making such belts, we had recently had to include all types, with the exception of maternity belts. He was prepared, however, to consider sympathetically any individual cases where the surrender of coupons caused real hardship.

Rushcliffe Committee on Nurses' Salaries—Mr. **Ernest Brown** stated on Nov. 19 that the last nominations for the Rushcliffe Committee on nurses' salaries were received early in November, 1941 There had been approximately 8 meetings of the full committee, 15 meetings of the employers' panel only, and 12 of the nurses' panel only Many of the meetings extended over more than one day. Mr. Brown added that he awaited replies from some of the organizations which he had consulted on the future distribution of nurses.

Housing—During the debate on the Address Mr. **Ernest Brown** said 100,000 families continued to live in houses which, three years ago, were legally condemned as unfit. The Government had to concentrate on first-aid repairs to houses damaged by enemy action, which numbered 2.750,000, apart from damage to glass. On the whole it had been found possible to deal with movements of population, but there was dangerous overcrowding in some districts. He and his colleagues were examining the possibility of making available labour and material for the extended repair of empty houses. He hoped that before the war ended they could start a modest problem of building new houses.

Vaccine Lymph.—Mr. **Ernest Brown** said on Nov. 24 that he had recently made an Order modifying the tests for the purity of vaccine lymph. The new Order allowed an increase in the total number of living bacteria and other visible micro-organisms, but it provided safeguards against harmful micro-organisms at least equal to those previously prescribed.

Pre-natal Child Allowances.—Sir **John Anderson** announced on Nov. 26 variations in the pay and allowances of the Forces. He said the Government had decided that children's allowances would be payable to the wives of sailors, soldiers, and airmen at the appropriate rate by the Service authorities from a date three months before the expected date of birth. Claims would have to be supported by medical certificates. Arrangements were being made to put this change into force from Dec. 1.

Fees for Vaccinations in Glasgow—On Dec. 1 Mr. **Johnston** informed Mr. Alfred Edwards that the amount paid by the Glasgow Corporation to doctors and medical students for vaccinations performed at the special vaccination stations opened in Glasgow on July 1 was £3,316. The doctors and medical students were paid by fees on a sessional basis, doctors receiving a fee of 31s. 6d. and medical students 10s. 6d. per session of 2½ hours.

Regulation 33B.—On Dec. 1 Mr. **Ernest Brown**, replying to Mr Pethick-Lawrence, said that under paragraph (3) of Regulation 33B a special medical practitioner could give a direction to a contact to attend a particular hospital. It was, however, open to a contact, on giving due notice, to transfer to another special practitioner at any time before the course of treatment was completed.

Notes in Brief

Lord Addison has been re-elected leader of the Labour Peers for the coming session in the House of Lords.

Medical News

The British Medical Students Association has arranged a conference at B.M.A. House, London, from Dec. 18 to 20—open to all medical students. Among the speakers will be the Minister of Health, Sir Charles Wilson, P.R.C.P., Prof. J. A. Ryle, and Dr. Charles Hill. There will be a dance on the evening of Saturday, Dec. 19, open to all members of the medical and nursing professions. Tickets (congress 1s. 6d., dance 3s. 6d.) from the secretary of the B.M.S.A., B.M.A. House, Tavistock Square, W.C.1.

The first annual general meeting of the Anglo-Soviet Medical Council will be held on Thursday, Dec. 17, at 4.30 p.m., at the Royal Society of Medicine, 1, Wimpole Street, W.

Prof. J. W. Munro, D.Sc., will give a discourse on "The Place of Research in the Control of Injurious Insects" at the Royal Institution, 21, Albemarle Street, W., on Friday, Dec 18, at 5 p.m.

The American Gastroenterological Association will publish on Jan. 1, 1943, the first number of a new monthly journal to be called *Gastroenterology*. The subscription price will be $6.00 a year. The editorial board invites clinical and investigative contributions which are of interest to the general practitioner as well as the specialist, and which deal with the diseases of digestion and nutrition, including their physiological, biochemical, pathological, parasitological, radiological, and surgical aspects. Manuscripts should be sent to Dr. A. C. Ivy, *Gastroenterology*, 303, East Chicago Avenue, Chicago, Illinois. Letters regarding subscriptions and business matters should be addressed to Mr. R. S. Gill, Williams and Wilkins Company, Baltimore, Maryland.

As only a small percentage of children are receiving the cod-liver oil and fruit juices that are available at food offices and welfare centres a publicity campaign to impress upon mothers the importance to children of these vitamin supplements is to be started by the Ministry of Health and Ministry of Food. Cod-liver oil will shortly be available to expectant mothers and also concentrated orange juice during the last six months of pregnancy.

Prof. F. E. Tylecote, M.D., F.R.C.P., has been elected chairman of the Manchester Public Health Committee He was also recently elected President of the Royal Manchester Institution (founded 1823).

The Swedish Medical Society of Stockholm has presented to Dr. Alfred Vogt, professor of ophthalmology at Zurich, the Gullstrand Medal, which is awarded every ten years to the most eminent ophthalmologists.

Prof. H. Mooser, director of the Institute of Hygiene of Zurich University, has been created an honorary member of the Royal Academy of Medicine of Barcelona for his researches on typhus fever recently made in Spain.

The Minister of Health (Circular 2707) has decided to extend to March 31, 1943, the period during which local authorities may submit arrangements made by them under the Cancer Act, 1939.

Universities and Colleges

UNIVERSITY OF OXFORD

In a Congregation held on Nov. 21 the following degrees were conferred:

D M.—H. W. Davies, T W Lloyd (in absence).
B M., B.Ch.—C. O. Carter

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

At the annual meeting of the College, held on Dec. 3, Dr. Charles McNeil was re-elected President and Dr. L. H. F. Thatcher, Dr. A. Murray Drennan, Dr. A. Fergus Hewat, Dr. D. M. Lyon, Dr. A. Graham Ritchie, and Dr. A. Rae Gilchrist were elected to form the Council of the College for the ensuing year. Dr. A. Fergus Hewat was nominated Vice-President.

FACULTY OF RADIOLOGISTS

The following candidates have satisfied the Fellowship Board at the examination for the Fellowship of the Faculty: *Radiodiagnosis.*—G. Friedlaender, M.D., D.M.R. *Radiotherapy.*—I. G. Williams, M.B., F.R.C.S., D.M.R.E.

EPIDEMIOLOGICAL NOTES

Discussion of Table

In *England and Wales* during the week there was a general rise in the notifications of infectious diseases. There were 1,085 more cases of measles, 91 of whooping-cough, 89 of acute pneumonia, 61 of diphtheria, 34 of scarlet fever, 18 of cerebrospinal fever. The incidence of dysentery fell by 31, and of typhoid by 7.

The rise in measles was fairly general throughout the country, but highest in the North. The counties reporting the largest increases were Derbyshire 229, Cheshire 107, London 118, Durham 100, Leicestershire 77, Lancashire 71.

The incidence of scarlet fever tended to fall in the South, and the only rises of note were those of Lancashire, Yorks West Riding, and Staffordshire, with 51, 47, and 42 more cases than last week.

The notifications of diphtheria were the largest since the beginning of January. During the present year about 40% of the cases have been reported from the three counties of Lancashire, Yorks West Riding, and Durham; during the week reviewed 188, 128, and 107 notifications came from these counties.

The largest increases in whooping-cough were those of Lancashire 54, and Yorks West Riding 42.

The incidence of dysentery has fallen by 60% during the past four weeks, but is still twice as high as during the middle of August. Lancashire, with a rise from 9 to 24 cases, distributed through eight administrative areas, heads the list: 11 further cases were reported from the existing outbreaks in each of the counties of Yorks West Riding and Yorks North Riding. Ten boroughs contributed the 18 cases notified in London.

In *Scotland* there was a mounting incidence of most infectious diseases, chiefly of acute primary pneumonia 61 cases, of diphtheria 49, and of scarlet fever 38. The largest local variation was the increase in the cases of pneumonia in Glasgow from 91 to 137.

In *Eire* poliomyelitis for the fourth consecutive week showed a slight rise; there were 25 cases from sixteen districts.

In *Northern Ireland* about half of the cases of infectious diseases were reported from Belfast, with the exception of whooping-cough, of which 24 of the 25 cases were recorded in Lisnaskea rural district.

Small-pox

Two further cases of small-pox were confirmed in Edinburgh on Nov. 30. The number of persons vaccinated in this city now exceeds 165,000. Another death has occurred from the recent outbreak at Methilhill; this brings the total of small-pox deaths in Fife to 8.

A case of small-pox has been reported from the London borough of Hampstead.

Returns for the Week Ending November 28

The notifications of infectious diseases in England and Wales during the week included: scarlet fever 2,970, whooping-cough 1,263, diphtheria 861, measles 10,649, acute pneumonia 766, cerebrospinal fever 77, dysentery 163, paratyphoid 4, typhoid 13, small-pox 1.

No 46

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended Nov. 21.

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for: (a) England and Wales (London included). (b) London (administrative county). (c) Scotland. (d) Eire. (e) Northern Ireland.

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for. (a) The 126 great towns in England and Wales (including London). (b) London (administrative county). (c) The 16 principal towns in Scotland. (d) The 13 principal towns in Eire. (e) The 10 principal towns in Northern Ireland.

A dash — denotes no cases; a blank space denotes disease not notifiable or no return available.

Disease	1942					1941 (Corresponding Week)

* Includes primary form for England and Wales, London (administrative county), and Northern Ireland.

† Includes paratyphoid A and B for Northern Ireland.

‡ Owing to evacuation schemes and other movements of population, birth and death rates for Northern Ireland are no longer available.

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to The EDITOR, British Medical Journal, B.M.A. House, Tavistock Square, London, W.C.1.

ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated.

Authors desiring REPRINTS should communicate with the Secretary of the Journal Board, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors over-seas should indicate on MSS. if reprints are required, as proofs are not sent abroad.

ADVERTISEMENTS should be addressed to the Advertisement Manager (hours 9 a.m. to 5 p.m.). Orders for copies of the *Journal* and subscriptions should be sent to the Secretary.

Telephone No.—B.M.A. and *B M J.*: EUSTON 2111

Telegraphic Addresses.—EDITOR, *Aitiology Westcent, London;* SECRETARY, *Medisecra Westcent, London.*

B.M.A. Scottish Office: 7, Drumsheugh Gardens, Edinburgh.

QUERIES AND ANSWERS

Sulphonamides for Leukaemia?

Dr J H. Douglas Webster (London, W.1) writes: In reply to Dr. J. Harton Rayner (Dec. 5, p. 684) a new untreated case of myeloid leukaemia was treated with sulphapyridine (M & B 693) about three years ago (in collaboration with Dr. C. E. Lakin and Dr. Lionel Whitby); two attempts were made, but each had to be abandoned owing to general toxic symptoms; the white count dropped, but rose immediately the drug was stopped. A remission followed *x*-ray treatment. The trial did not encourage a repetition in other cases. (A note was published on the case in my *Periodicity of Cancer, Leukaemia and Allied Tumours,* 1940, p. 144.)

Death by Lightning

Dr. Stefan Jellinek (Oxford) writes: Dr. H. M. Stanley Turner (Oct. 24, p. 503) rightly stresses the "potential importance" of the "electrical traces," a few examples of which I was able to demonstrate in the course of an address to the Royal Society of Edinburgh in 1936. These are alterations in the tissues characterized by certain geometrical patterns. Their decisive importance has already been proved in a number of legal actions, such as the case of a young girl of 18 in which homicide or an attempt at suicide was suspected or that of a country house destroyed by ? lightning or arson. But apart from their interest to the medical jurist, electrical traces are of importance in a general legal sense A Dutch plane crashed near Baghdad in 1934. Passengers and the crew were killed and drunkenness of the pilot was alleged as a cause of the disaster. A little while later word went round that the plane had been struck by lightning. I was approached by the Koninklijke Luchtvaart Maatsch. voor Nederland en Kolonien with a view to establishing the truth of these rumours. The debris of the plane was examined according to my instructions. "Electrical traces" were in fact found and their identity was proved with traces present on objects kept in my electropathological museum in Vienna and known to have been damaged by lightning. Thus the truth was established and the honour of the dead pilot restored. Once found, no doubt concerning the significance of such "traces" can be entertained, since they can be reproduced experimentally. In 1937 I published my findings, including photomicrographs of geometrical deformities in cell nuclei (larva of *Salamandra maculosa*), at the Académie des Sciences in Paris (*C. r. Acad. Sci.*, Paris, 1937, p. 1962). Finally, "electrical traces" are of clinical and therapeutic significance; they may be observed after electrocautery by the surgeon and following the application of ultra-short waves by the physician. Dr. Alfred V. Dill (Oct. 10, p. 426) very rightly draws attention to anti-lightning safety devices in aeroplanes. It is possible that another examination of the bomber concerned would result in a different interpretation. The "traces" are not always visible with the naked eye. Sometimes microscopical investigation is necessary and able to reveal startling pictures.

Income Tax

Practice in Commission

"Aldershot" entered the R A.M.C. in July, 1942; continuing receipts from practice are small, including part fees from a colleague. Shall he claim (*a*) that the practice shall be regarded as ceased or (*b*) the relief to diminished earned incomes?

*** Admittedly the "civil" receipts are likely to be small, but "Aldershot" might find it difficult to establish that his former practice had ceased, and the alternative relief will apparently give him substantially the same advantage. Further, it is likely to have the additional attraction that it will not prevent the continuous operation of the previous year's basis in the future, an obvious advantage in the first year of "Aldershot's" return to full civil work.

LETTERS, NOTES, ETC.

Working for a Salary in the S.M.S.

Dr. Reginald Lawrence (Wakefield) writes: I must controvert the implication of Dr. Una Westell's letter (Nov. 7, p. 561) that a salaried worker inevitably deteriorates. School medical inspection, especially if done on five days a week, is the most deadening occupation in the practice of medicine, yet some members of the service never fail to produce some original work. Few people outside those immediately interested read the annual reports of the Chief Medical Officer to the Board of Education; if they did they would be surprised to see the list of original inquiries undertaken and carried out by members of this salaried service. In contrast to this intellectual activity I can point to voluntary hospitals of which the staff have not made an original contribution to medical literature for twenty years. The School Medical Service, in spite of working for a salary, has caused two quiet but real revolutions. (1) The observations of its members, as shown in the massed statistics of the Chief Medical Officer, have shown that operations for the removal of tonsils and adenoids which were formerly undertaken cheerfully (and profitably) must in many cases have been unnecessary. This alteration in medical opinion is, I believe, due to the irrefutable evidence that in many cases these overgrowths of lymphoid tissue will disappear without leaving any evil legacy. (2) The School Medical Service has brought the subject of nutrition to its proper place—the forefront of medical endeavour—and I have no hesitation in saying that members of this salaried service know more about the clinical aspect of subnormal nutrition than any other group of medical practitioners.

Unreliable Vaginal Pessaries

Dr. Lilias M. Blackett Jeffries (Hove, Sussex) writes: Within the last few weeks there has been a marked increase of patients who have started an undesired pregnancy in spite of using quinine pessaries. I am told that these are widely advertised, that "the Army" has complete confidence in them, and, finally, that "the medical officer" recommended them as reliable. It is surely agreed among the profession that safety can only be assured by the use of both an occlusive pessary and a spermicidal paste or tablet together. I write in the hope that readers of the *Journal* will use their influence to prevent the distress and danger which are following the public's misplaced confidence in medicated vaginal pessaries.

Corrigendum

By a printer's error the word "no" was omitted between the words "given" and "time" in the third paragraph of Dr. K. R Ogilvie's letter on the treatment of gonorrhoea (Nov. 28, p. 648).

MEDICINE 100 YEARS AGO

Extract from a letter by Dr. John Ashburner, of 55, Wimpole Street, published under the heading "Physiology of the Nervous System" in the *Provincial Medical Journal* of Dec. 10, 1842:

"Gentlemen,—In addressing to you the following brief remarks, I make an effort to stem the torrent of narrow and illiberal feeling which appears to pervade the medical profession. In your notice respecting the proceedings of the Royal Medical and Chirurgical Society, you 'regret extremely that the society should have lent itself to a proceeding so unworthy of its dignity and reputation' And what is that proceeding? The reading of a paper presented to the attention of a society by two gentlemen, containing an account of a case of 'amputation of the thigh, *alleged* to have been performed during Mesmeric sleep.' Are medical men to forget that they belong to a *royal* association? Are the courtesies of life between gentlemen and gentlemen to be lost sight of, when folks step within the limits of a medical circle? Are surgeons who are esquires, and barristers who hold an equal rank, to be flouted with the insinuation of falsehood, because they dare to relate facts which militate against the narrow prejudices of would-be philosophers? Do you know, Gentlemen, what impression the expressions you have used make upon impartial men that belong not to our profession?

"I happen to be no 'advocate of the delusion,' as you please to term it, of Mesmerism. I ought with shame to say that I have derided, perhaps with much want of courtesy, the accounts I have heard of the wonders of animal magnetism. I have seen enough to know that I was wrong—that there are connected with the subject facts which demand inquiry; and inquiry they must have, whether you like it or not I tell you, Gentlemen, and all who oppose the investigation of truth, that time marches past you, and that the world will not wait until it suits the high mightiness of doctor bodies to lay aside their paltry feelings. Men of small minds will be pitied, and men of moral courage will not shrink from inquiry because the objects of their pity may presume to bow-wow at them."

RENAL FAILURE AFTER UTERO-PLACENTAL DAMAGE

BY

JAMES YOUNG, D.S.O., M.D., F.R.C.S., F.R.C.O.G.

Professor of Obstetrics and Gynaecology, University of London

(From the British Postgraduate Medical School, London)

There are two conditions in obstetrics in which massive damage affecting the placenta, uterine muscle, or other pelvic tissues may be followed by renal insufficiency and azotaemia—accidental (retroplacental) haemorrhage (Young, 1942) and the trauma of labour (Young and McMichael, 1941). They show the same clinical sequence. (1) There is the initial tissue damage. (2) In severe cases there is "shock," which may be immediately fatal. In milder cases there may be an absence of shock. In cases which survive the shock there are (3) anuria or oliguria, with a urine containing hyaline and granular casts and leucocytes, and (4) a rising blood urea which reaches its maximum usually between the 5th and 9th days and which is followed by death or by an increasing diuresis and eventual recovery. These two clinical states resemble the "crush syndrome" (Bywaters and Beall, 1941). In the latter condition the chief histological changes are found in the kidney; these have recently been fully described by Bywaters and Dible (1942). They consist of a degenerative and necrotic lesion specially affecting the ascending limb of Henle and the second convoluted tubule, usually with the presence of pigmented (myohaemoglobin) casts. We have recently drawn attention to the similarity between the shock-azotaemic state following the trauma of difficult labour and the crush syndrome (Young and McMichael, 1941). Further evidence, to be published later, suggests that this state is by no means a rare sequel of difficult obstetrics.

The other obstetrical condition in which shock and renal failure are relatively frequent—namely, concealed accidental (retroplacental) haemorrhage—is the especial concern of the present communication. The evidence to be adduced again indicates that in the aetiology of the renal failure the same two factors emerge for consideration—the liberation into the general circulation of blood pigment which is excreted by the kidneys, and tubular damage. The clinical syndrome in concealed haemorrhage is confused by the eclamptic phenomenon (pre-eclampsia and eclampsia) which invariably accompanies it, generally in the form of severe albuminuria, hypertension, oedema, blurred vision, etc. This association is no mere haphazard one. For it has long been known that haemoglobinaemia and haemoglobinuria not infrequently occur in eclampsia associated sometimes with renal failure and with a renal lesion exhibiting blood-pigment casts and tubular degeneration. The accidental-haemorrhage syndrome is to be regarded as a variant of the pre-eclamptic and eclamptic picture, with the renal failure element thrust into the foreground.

The purpose of the following communication is to discover how far these similarities between the crush and obstetrical syndromes rest upon any basic identity in regard to genesis. In this connexion the massive ischaemic lesion in the placenta and uterine wall found in the obstetrical state calls for special consideration.

The manner in which tissue trauma leads to renal failure is uncertain. It has been suggested that the blood pigment released from the autolysed muscle may act by causing damage to the tubular epithelium or blockage of the tubular lumina. Alternatively, it is possible that the tubular degeneration is determined by the toxic action of some other material derived from the autolysis of the damaged muscle and that the blood pigment merely represents the myohaemoglobin liberated at the same time and precipitated in the tubules during excretion. There is also to be considered the possible influence of the shock phenomena (circulatory collapse, vasoconstriction) acting alone or in combination with the other factors.

The Accidental-haemorrhage Syndrome

In some cases the patient is known to have been previously suffering from pregnancy toxaemia, and the accidental haemorrhage then forms the critical and terminal phase. In other cases the pregnancy is normal up to the acute onset. This consists of abdominal discomfort and pain, often acute. Faintness and vomiting are common, with pallor, shivering, sweating, and rapidity (sometimes slowing) of the pulse. There may be vaginal bleeding. The blood pressure may be lowered to shock levels, but this is not usual and it is apt to be followed by early death. The urine is completely suppressed or is greatly reduced in amount. It is dark red or plum-coloured and contains a large amount of albumin with hyaline and granular casts and leucocytes. Pigment casts are sometimes present. In the first sample the urine urea may be in high concentration; thereafter it quickly falls to low levels. Within two days the blood urea is raised, and may reach a high level between the 5th and 9th days. The patient succumbs about the 7th to 10th day or, alternatively, there is a free diuresis, a rapid drop in the blood urea, and eventual recovery, which may apparently be complete. This is the picture in the severe type; but all grades of severity are found, and in some cases eclamptic convulsions are present. The lesion consists of marked distension of the decidual vessels with thrombosis and free extravasation in the retroplacental area. In some instances there is an accompanying widespread haemorrhagic lesion in the uterine wall ("utero-placental apoplexy"). The area of placenta thus deprived of its blood supply dies and, in minor cases in which continuing pregnancy is possible, undergoes infarction. In severe cases the massive placental involvement results in early foetal death and delivery. But the maternal circulation may continue and the foetus may survive for hours even after as much as half of the placenta is so thrown out of the blood circuit and is undergoing autolysis. A partial circulation may even persist for some time in this affected segment. The cause of this utero-placental lesion is unknown. It is determined by a critical interference with the maternal circulation by those factors (probably generally hormonal in nature) which are commonly responsible for abortion in the early months of pregnancy. In the present instance, however, they are operating in the later months, when it is alone possible for a partial circulation to persist despite the occurrence of massive autolysis in the adjacent segment of the placenta (Young, 1914, 1942).

The Kidney Lesion.—Bratton (1941) in 6 fatal cases of antepartum bleeding with anuria or oliguria found a renal lesion resembling that seen in the crush syndrome. In none had blood transfusion been given. With the collaboration of Dr. Bratton and the medical superintendents of the hospitals concerned we have had the opportunity of studying the records of five of the cases. In three with anuria and the full renal picture the clinical evidence suggested that the patients had suffered from accidental haemorrhage between the 26th and 28th weeks of pregnancy. In one patient, as Bratton indicates in his paper, there was a haemorrhagic and necrotic lesion in the liver. In one of the remaining two cases the patient suffered from concealed accidental haemorrhage and eclampsia at the 30th week of pregnancy.

Through the kindness of Prof. R. W. Johnstone we have obtained for personal study the clinical notes and pathological material from 4 fatal cases of accidental haemorrhage. In none had blood transfusion been given. This material was submitted to Prof. J. H. Dible, who has kindly furnished the description of the microscopical appearances of the organs and the comments included in the following statement.

Case 1

Para 0+1 abortion; aged 28. March 17, 1940, 6 a.m.: Sudden onset of dizziness and dimness of vision. 8 a.m.: Severe abdominal pain and vaginal bleeding; pale, pinched, cold, and clammy; pulse 70; B.P. 130/80; urine—albumin + + +; uterus tense and tender; foetal heart not heard. 1.10 p.m.: Spontaneous delivery of stillborn child weighing 4 lb. 2 oz. (36 weeks' maturity), followed by large amount of dark-red blood clot and torn-up and infarcted placenta. 1.30 p.m.: Pulse soft and irregular, but still slow; glucose-saline given intravenously, with strychnine, adrenaline, and nikethamide (coramine). 2.55 p.m. (1st day): Died. The interval between the onset of the acute symptoms and death was thus 8 hours 55 minutes.

Kidneys.—Slightly softer than usual, with on section a pale-yellow surface in which the cortex and medulla were fairly well differentiated. In the subcapsular region there were a few small haemorrhages. *Microscopical.*—"The tufts are generally rather bloodless. The capsular spaces are filled with protein material. There is marked hyaline droplet degeneration of the cells of the first convoluted tubules. The cells are swollen and desquamating; their brush borders are lost and their lumina are full of debris. This condition is continued into the descending limb of Henle. At one site in the intermediate zone a focus of necrosis with hyaline casts in the ascending limb is found. The second convoluted tubules do not show the same severe cellular change. Their cells are a little pyknotic and they tend to contain casts of a condensed and hyaline type. No pigment or necrosis is found in these tubules. A considerable number of collecting tubules show long dense hyaline casts, but these are not pigmented. *Comment.*—The lesion is an acute 'toxic' tubular nephritis. It is similar to the early stage of the crush syndrome in this respect, but differs from this in that the damage to the first convoluted tubule is more pronounced. *Other organs.*—The lungs are congested, oedematous, and emphysematous, but the liver, spleen, and heart show no noteworthy changes."

Case 2

Para 7; aged 30. Feb. 4, 1937, 11 a.m.: Slipped and fell heavily on stone stairs at 28th week of pregnancy. In the evening she had fairly severe vaginal bleeding and fainted. Feb. 5, 12.15 a.m.: Admitted to hospital; drowsiness; marked oedema of hands and feet; B.P. 135/80; a "few ounces" of dark-brown urine withdrawn by catheter—albumin + + +; membranes ruptured artificially. 2 p.m.: No urine passed; catheter withdrew 60 c.cm. of "dark-brown viscid urine"; R.B.C.s and granular and hyaline casts present; blood urea 54 mg. per 100 c.cm. 7.30 p.m.: 10 drops of "oily black urine" withdrawn; under a short gas–oxygen–ether anaesthesia bipolar version was performed and 1/2-lb. weight attached to ankle of child. Feb. 6, 1 a.m.: Delivered; child 3 lb., stillborn; large amount of dark retroplacental clot. During the next 7 days patient had marked oliguria despite a large intake of glucose-saline solution. The blood urea was not recorded, but on two occasions (8th and 10th days) the urine urea was 300 mg. per 100 c.cm. The minimum blood pressure until the terminal stages was 130/70. Feb. 13 (10th day), 10.25 p.m.: Died.

Kidneys.—Moderately enlarged and fairly firm. The surface in each was diffusely congested and the cortex and medulla were fairly well differentiated. The cortex showed some increase in depth. Each capsule stripped readily, exposing a smooth surface, over which multiple petechiae were scattered. *Microscopical.*—"The glomeruli do not show any noteworthy changes. The tubules are generally dilated. The first convoluted tubules contain debris, desquamated cells, and globular masses; they are, however, fairly well preserved and there is no widespread cellular necrosis. Many of the second convoluted tubules show marked lesions. Their interior contains casts, which are made up of granular material that is lightly pigmented. The presence of this pigmented material is associated with a pronounced cellular reaction—desquamation, degeneration, and regeneration of the epithelium and some polymorph infiltration. Similar changes are seen in the ascending limb of Henle. In the region of the second convoluted tubules and in the boundary zone necrotic tubules and foci of cellular reaction (similar to those described by Bywaters and Dible) can be seen. In the medulla there are oedema and foci of lymphocytic and plasma-cell infiltration. The collecting tubules contain pigmented casts and pigmented necrotic cells and show epithelial proliferation. *Comment.*—The picture is practically indistinguishable from that found in the kidney in cases of the crush syndrome. *Other organs.*—The liver and heart do not show any noteworthy changes."

Case 3

Para 0; aged 24. June 1, 1939: Admitted because of oedema of ankles at term; B.P. 130/100. Remained satisfactory. On June 17, 5 a.m., artificial rupture of membranes. 6 a.m.: Labour started. 2 p.m.: Vomiting. 11 p.m.: Sudden onset of severe abdominal pain with collapse and sweating; foetal heart ceased and concealed accidental haemorrhage diagnosed; 1/4 gr. morphine given, and intravenous drip saline. 12 midnight: Delivered by easy low forceps after craniotomy to diminish size of head. Placenta expelled one hour later: no blood loss. Examination of the placenta showed a portion which seemed to have separated prematurely. There was marked oliguria (the maximum daily output being 140 c.cm. on 4th day), and the blood urea on 7th day was 164 mg. per 100 c.cm. Treatment: glucose-saline, 10% glucose, sodium sulphate, 20% glucose. The lochia became offensive. Coma developed and on June 25 (9th day), at 10.10 a.m., the patient died.

Kidneys.—Both swollen and moderately firm. Abnormally broad pale cortex and reddish-brown medulla, both areas being oedematous. Each capsule stripped readily, exposing a smooth pale surface. *Microscopical.*—"The glomeruli tend to be bloodless but show no anatomical change. The first convoluted tubules contain a good deal of debris, are generally dilated, and their epithelium is flattened; the cells are not well preserved and there is some widespread necrosis. The second convoluted tubules are pyknotic. Many of them contain lightly pigmented granular cast material. In connexion with this there is epithelial desquamation and necrosis, some of the necrosed epithelial cells absorbing pigment. Most of the nephrons are affected. Changes in Henle's tubules are minimal. The medulla shows lymphocytic and plasma-cell infiltration. A majority of the larger collecting tubules contain pigmented casts, reproducing the picture of 'blockage' seen after intravascular haemolysis—as, for example, in fatal incompatible blood transfusion. *Comment.*—This picture is essentially similar to that found in the kidney in the fatal anuria of the crush syndrome. *Other organs.*—Liver: Typical patchy eclamptic necrosis. Lung: Oedema, emphysema, acute bronchitis, and early bronchopneumonia. Pituitary: Acute necrosis of the anterior lobe. The heart and spleen show no noteworthy changes."

In the fourth case the appearances were those of bilateral cortical necrosis, the rare lesion which has long been associated with cases of accidental haemorrhage resulting in death with uraemic symptoms. The difference in the causal factors responsible for two such striking variants in the renal lesion is a matter for further study. Meanwhile it is interesting and perhaps relevant that cortical necrosis has been described in a case of traumatic anuria (McFarlane, 1941).

Discussion of the Aetiology of the Renal Failure

The following factors, operating singly or in combination, call for consideration in this connexion: (1) shock, (2) haemolysis and tubular blockage, and (3) a toxic material or toxic materials of tissue origin. For this study we have 5 personal cases associated with renal impairment and a significant rise in blood urea out of a total consecutive series of 79 cases of accidental haemorrhage. All 5 patients recovered.

Shock

This may be severe, and a considerable proportion of the mortality from accidental haemorrhage is due to this cause. That the collapse of haemorrhage does not in the present series explain the kidney lesion is suggested by the fact that, in 59 consecutive cases of obstetrical haemorrhage (post partum, from placenta praevia, accidental haemorrhage) so grave as to require blood transfusion, renal failure is restricted to the accidental-haemorrhage group (Table I).

TABLE I.—*Severe Haemorrhage at Childbirth necessitating Blood Transfusion. Analysis of 59 Consecutive Cases*

	Cases	Renal Impairment
Post partum	37	0
Placenta praevia	12	0
Accidental (retroplacental)	10	5

This table demonstrates the correlation between renal impairment and accidental haemorrhage and suggests that the former is determined by some factor other than the shock of haemorrhage. Further, it can sometimes be clearly established that the renal impairment antedates the shock phenomena.

Case 4.—Mrs. M., aged 27, walked into hospital at 7 p.m. with lower abdominal pain and thinking she was in labour. She was unable to pass urine, and next morning the catheter revealed an empty bladder. The general clinical condition was good; blood pressure 120/80 mm. Hg. During the rest of the day the suppression continued. At 5.30 p.m. she developed acute abdominal pain with severe shock. Diagnosis: Concealed accidental haemorrhage. Bladder empty. The suppression of urine had thus existed for 22½ hours before the first onset of shock.

Case 5.—Mrs. E., aged 37, wakened at 7 a.m., rose, and passed urine as usual. She prepared her husband's breakfast, and later in the morning, in her usual health, went shopping. At 11 a.m., on the way home, was seized with abdominal pain; walked home and went to bed. At 12 noon felt sick and vomited. Sent to hospital at 5.30 p.m. in condition of shock (with pallor, shivering, perspiration, and rapid pulse), but with B.P. 155/98. Diagnosis: Concealed accidental haemorrhage. 3 c.cm. urine withdrawn by catheter. No urine had been passed since 7 a.m. She thus had suppression for 10 hours, and this antedated the shock.

These cases further exemplify how the causal agency has a selective action on the kidney.

An added argument against the view that the renal failure is a local expression of general circulatory collapse due to shock is the frequent absence of hypotension. In 4 out of the present series of 5 cases of accidental haemorrhage the blood pressure was recorded at frequent intervals, and the respective minimum readings up to the time when the kidney impairment was firmly established were 100/70, 110/90, 155/98, 145/86. The relatively high pressure levels in some of these women are clearly related to the coexisting hypertensive toxaemia.

Dunn and Montgomery (1941) have suggested that bilateral cortical necrosis, the rare variant of the renal lesion, which is also remarkably selective in its character, may be due to circulatory failure from haemorrhagic "shock" with complete stagnation of the blood flow in glomeruli previously damaged by the eclamptic "poison." Such an explanation, however, does not seem to be valid for the lesion now under discussion. We have seen (1) that the selective lesion may be tubular, with a relative immunity of the glomeruli; (2) that renal failure does not follow the shock from other forms of obstetrical haemorrhage (post partum and from placenta praevia) complicating the eclamptic state; (3) that the renal failure may develop before the "shock" while, in other cases, there may at no time be hypotension.

The data invite some further tentative conclusions on the aetiology of the shock phenomena. In accidental haemorrhage shock may be severe and even fatal, and in some cases the blood loss by itself is clearly a determining factor. That, however, there may be another factor, or other factors, is demonstrated by those cases in which the degree of shock is out of proportion to the amount of bleeding (Whitridge Williams, 1925) and by the frequency with which it fails to respond to the therapeutic influence of blood transfusion (Sheehan, 1942). In the evolution of shock in surgical trauma the fall in blood volume caused by the loss of plasma to the damaged tissues is believed to play an important part. In the case of accidental haemorrhage there is no clear evidence of such a mechanism. Although there may be oedema of the uterine wall (especially when the retroplacental bleeding is associated with a muscular lesion—"utero-placental apoplexy") this local loss of blood fluid to the tissues cannot be regarded as an adequate explanation of the total phenomena. We have not found evidence of haemoconcentration, though this may, of course, be obscured by the haemorrhage, and it is known that the eclamptic state may be accompanied with marked haemoconcentration due to the explosive generalized oedema (Zangemeister, 1903). This haemoconcentration, which may develop rapidly in the crisis of the eclamptic state, may, however, be associated with an equally rapid rise in blood pressure, even to high levels, and with a clinical condition which in this respect is the reverse of shock (Dieckmann, 1942). Further, in many instances, although the shock phenomena may be clinically brisk, the accompanying hypertensive state, as in the 4 surviving cases reported in this communication, would seem to protect the patient against the major risks. It is only when the "shock factor" breaks through this protective hypertensive state and paralyses the vasomotor mechanism that the full shock effect is induced. Whether this action is central or peripheral it is impossible to say. This view of the genesis of the initial shock often seen in such cases resembles the conclusions of Noble and Collip (1942) based upon the study of experimental trauma in rats. They conclude that a poison is generated by the damaged tissues and that this can cause death rapidly from shock with little haemoconcentration. Only where death is delayed is there the development of a severe haemoconcentration due to the loss of blood plasma through the capillaries. Glen (1941) has shown, also, that the shock may develop so rapidly after the restoration of the circulation in an ischaemic limb as to suggest the immediate effect of a circulating poison.

We may summarize the above evidence as follows. The data are opposed to the view that the shock mechanism is essential for the production of the renal lesion. This is dependent upon some other influence whose action on the kidney may be strikingly selective. Neither haemorrhage nor the loss of blood fluid to the tissues (local or general) with haemoconcentration is an adequate explanation of the shock phenomena. To explain the full shock effect we must postulate some other factor (toxic agent?).

Haemolysis and Tubular Blockage

The eclamptic phenomenon is apt to be associated with haemoglobinaemia and haemoglobinuria. Many references to these conditions are to be found, especially in German literature. Schmorl (1893), in 2 out of the 17 cases on which his classical monograph on the pathology of eclampsia was based, described the presence of yellow pigment in the collecting tubules of the kidney. In one case, in which the urine was plum-coloured, the pigment was also present in the epithelial cells. Brütt and Schumm (1918) reported 6 cases of eclampsia with haemoglobinaemia in which there were haematin casts in the urine. In a fatal case with marked oliguria there were abundant haematin casts in the straight and Henle tubules. Fahr (1924) found haemoglobin casts in the kidney tubules in 18 out of 33 fatal cases of eclampsia, and regards this appearance as next only in importance to the glomerular changes in the total renal lesion of eclampsia. He points out that this incidence is higher than one would expect from the frequency of haemoglobinuria as clinically recorded in eclampsia by Meyer-Wirz and Geipel (6 in 44), Konstantinowitsch (6 in 30), and Zangemeister (5 in 14). At the same time he points out that the haemoglobin casts are often few in number. In general these German writers have regarded this haemolytic process as one of the side-effects of the eclamptic "poison"—an effect which it shares with other poisons, such as arsenic preparations, nitrobenzol, quinine, etc. The haemoglobinaemia and haemoglobinuria are clearly related to the acme of the eclamptic attack, and subside quickly thereafter. The Continental investigators were also aware of the association between haemolysis and the azotaemic type of renal failure dependent upon tubular degeneration (Brütt and Schumm, 1918; Seitz, 1927; Spitzer, 1934). In this country Dunn and Baird (1933) found haemoglobin casts in the kidneys in 3 out of 10 cases of eclampsia.

These investigations have acquired a new significance by their revelation of the close resemblance between the haemolytic phenomenon in eclampsia and its accompanying renal lesion and the changes found by Bywaters and Beall (1941) to follow a massive ischaemic lesion of muscle and by Bratton (1941) and ourselves in the accidental-haemorrhage syndrome. It has been suggested that in the crush syndrome the anuria may be due to blockage by the pigmented casts. But, as Bywaters and Beall (1941) have pointed out, any urine excreted in such cases may differ little from a glomerular filtrate, thus indicating the existence of severe damage even in non-obstructed tubules. Further, in an early case there may be tubular lesions in the absence of casts.

The same considerations apply to the kidney in accidental haemorrhage. In a woman who died 9 hours after the onset of symptoms there were no pigmented casts, but the tubular degeneration was evident; whilst in another case, with 22½ hours' anuria, pigmented casts were absent. We have had the opportunity of examining the kidneys in two women who died with anuria, 6 days and 9 days respectively after an eclamptic attack. In the former case there was a typical tubular lesion with blood casts and a blood-urea figure of 173 mg. per 100 c.cm.; while in the latter, in which the tubular degeneration was characteristic and the blood-urea reading 222 mg. per 100 c.cm., there were no pigmented casts. These findings suggest that the blood casts are necessary neither for the initiation of the renal failure nor for the development of the renal lesion.

Toxic Material or Materials of Tissue Origin

The elimination of competing factors in the aetiological field serves to direct attention to the immediate influence of the massive tissue damage, which establishes a basic link between the obstetrical and the crush syndromes. This brings us to the correlation between the "concealed" type of accidental haemorrhage and renal impairment (Table II).

Table II.—*Relation of Type of Accidental Haemorrhage to Renal Impairment. Analysis of 79 Consecutive Cases*

Haemorrhage	Cases	Albuminuric Toxaemia	Toxaemia + Renal Impairment
Revealed ..	59	7 (11·8%)	0
Concealed ..	20	13 (65·0%)	5 (25%)
Totals ..	79	20	5

These results conform to those of other observers. The table shows that the albuminuric type of toxaemia is much more frequent in "concealed" (65.0%) than in "revealed" (11.8%) cases, and that the renal insufficiency is associated especially with the "concealed" type.

The distinctive features of the utero-placental lesion of "concealed" accidental haemorrhage have been discussed elsewhere (Young, 1914, 1942). One feature of immediate relevance is that after the production of the lesion, which in the cases we are discussing generally involves as much as half and sometimes even more of the organ, the placenta is retained for some time within the uterus. Where the circulation is maintained in the undamaged portion, with resulting foetal survival, the conditions are such as to favour the escape into the systemic blood stream of any toxic materials which may be generated in the dying area. The circumstances are then similar to those which have been postulated in the case of surgical trauma after the circulation has been re-established in the crushed limb. To this analogy we referred many years ago (Young and Miller, 1921). Elsewhere we (Young, 1942) have given evidence that the "toxaemic" state is immediately related to the massive placental lesion. Thus there is a recognizable quantitative relation between the severity of the toxaemia, on the one hand, and the mass of placenta involved and the period of foetal survival, on the other. When the lesion is so fulminating as to cause complete initial detachment there is no toxaemia, and where, after the onset of toxaemia, the lesion progresses to the stage of causing foetal death there may be an abrupt decline of the toxaemia. This evidence, and evidence of a like nature in ordinary cases of eclampsia and pre-eclampsia, in which, however, there is generally no history of accidental haemorrhage, have formed the basis of the placental hypothesis of the eclamptic phenomenon (Young, 1914, *et seq.*). Evidence has been given that the interference with the uterine circulation which causes the placental lesion is the expression of an antecedent abortion taint (Young, 1927, 1942).

It is firmly established that renal failure with azotaemia is rare in eclampsia and pre-eclampsia. The relatively high incidence (25% in the present series) of renal impairment in concealed accidental haemorrhage would seem, therefore, to be determined by some factor introduced into the eclamptic and pre-eclamptic state by the conditions obtaining in concealed haemorrhage. What this factor is we do not know. It does not seem to connote a quantitative relation to toxaemia, for renal failure is rare even in severe eclampsia not associated with concealed haemorrhage. The massive muscular lesion in the uterus, to which reference has already been made, is especially identified with cases of concealed haemorrhage, and it provides a striking analogy to the conditions in the crush syndrome. But there is some evidence that this lesion may be present in a marked degree without renal failure (Whitridge Williams, 1925; Dieckmann, 1936). Nevertheless it merits fuller consideration. Its existence helps to explain the very high incidence of puerperal sepsis in such cases (Whitridge Williams, 1925; Gibberd, 1936; Bratton, 1941).

The immediate cause of the bleeding in the decidua and muscularis is not clear. There would seem to be no doubt that it is an expression of the "abortion taint," to which reference has already been made and which has been discussed more fully elsewhere (Young, 1942). Reasons have been given for the view that it precedes the placental autolysis (Young, 1914, 1942). This evidence is, however, not unequivocal, and it remains possible that the placental degeneration antedates and determines the retroplacental and muscular lesions. It cannot be claimed that the haemorrhagic lesions are due to a systemic "toxaemia," because out of 79 cases of accidental haemorrhage albuminuric toxaemia was absent in 59, including 7 of the 20 cases of the concealed type (Table II). It is possible, however, that the massive blood effusions in these sites are due to vascular damage by a toxic agent locally produced, and that the purpuric and haemophilia-like haemorrhages occasionally found in accidental haemorrhage in such distant sites as the nose, stomach, and subcutaneous tissues (McGoogan, 1935; Dieckmann, 1936) may be a more generalized manifestation of the same factor. On this question further information is desirable.

Summary

The foregoing clinico-pathological study of the syndrome in concealed accidental haemorrhage suggests the following proximate causes: (1) The syndrome is determined by a massive utero-placental lesion of ischaemic origin. (2) The renal failure characterized by tubular degeneration and azotaemia is determined by a toxic material derived from tissue autolysis. (3) The shock element and the haemolysis which are frequently present may have a similar origin.

This paper is published with the permission of the Medical Officer of Health, London County Council. The help of Prof. J. H. Dible is gratefully acknowledged, and also of Dr. A. F. Anderson in the collection of the clinical material in Edinburgh.

LOCALIZED TYPHOID FEVER OUTBREAK IN GLASGOW, 1942

BY

R. J. PETERS, M.D., D.P.H.

AND

D. H. CLUTTERBUCK, M.B., D.P.H.

(*From the Public Health Department, Glasgow*)

The following is a description of a small localized outbreak of typhoid fever which presented some rather unusual features and for that reason is considered to be worth recording. The cases, of which there were 41 in all, occurred among the staff and customers of a butcher's shop in one of the poorer districts of Glasgow. The outbreak took place at the end of winter at a time when otherwise the city was free from enteric infections.

General Description of the Outbreak

The first indication of the existence of typhoid fever came on Feb. 6, when 3 cases, all in one family, were diagnosed as this disease. These patients had been admitted to an infectious diseases hospital on Feb. 4. A second group, of 4 cases, consisting of a mother and three children, were removed to another infectious diseases hospital on Feb. 6; and a third family group, consisting of two children, came to notice on the following day. Up till this time all the patients had been women or young children; but on Feb. 9 a fourth family became affected, the patients being two adolescent males aged 15 and 17. Thus within the first two days of our knowledge of the outbreak three families were involved, giving rise to 9 cases.

At first the age and sex distribution caused the investigation to be concentrated on the milk supply, which was common to the first three families; but before reports could be obtained upon the bacteriological specimens submitted, further cases had come to light in which there was no obvious connexion with the dairy. The preliminary investigation had, however, shown that all the infected families received their meat supplies from a butcher's shop in the district, though the usual routine inquiry had failed to incriminate any special meat product. It became clear, however, that the butcher's shop was the only common link between the cases. Specimens of faeces and blood were examined from the staff, which consisted of five persons, with the result that one male employee was found to have *B. typhosus* in stools and urine, and a blood agglutination for *B. typhosus* of 1 in 2,500. A second male employee had a positive agglutination reaction (1 in 250), but in his case there were no other positive findings even after investigation in hospital. He had been inoculated against typhoid during the last war. The former case (J. P., aged 62) was ultimately regarded as the probable cause of the outbreak. This man subsequently died of typhoid fever in hospital, and his case is discussed in more detail below.

Further investigation disclosed sickness, later confirmed as typhoid fever, in a female employee who had left the butcher's employment on Jan. 24—that is, before the occurrence of the cases. She lived in another part of the town. The date of onset in her case—Jan. 27—coincided with the starting of the epidemic, so that she is to be regarded merely as one of the cases and not as the original source of infection.

Intensive house-to-house visitation of the district was carried out by the medical officers and sanitary inspectors, and at the same time a circular letter was addressed to local medical practitioners advising them of the presence of the disease. Suspicious febrile cases were removed to hospital for observation, and a frequent and careful check-up was made on all family contacts. The intensive visitation and follow-up of contacts were generally successful in preventing the occurrence of secondary cases. Daily visits were paid to the butcher's shop, and a complete overhaul was made of the hygienic arrangements, which were on the whole of a very low order. All cooked meats found in the shop were destroyed. Some of the customers' ration cards were in an incredibly filthy condition, and it was observed that the shop-assistants handled these cards and then handled meat. By arrangement with the local food office large numbers of ration cards were withdrawn and fresh ones issued. This may not have had any bearing on the genesis or spread of the outbreak, but nevertheless it is a matter worthy of careful consideration from the point of view of the hygiene of food-handling generally.

One case occurred among the attendants of a public wash-house in the area. This patient had no direct connexion with the butcher's shop and took no food at all in the district; but since many of the patients' families were in the habit of taking clothes to the washhouse, he was probably infected by an article of clothing belonging to a typhoid case, although this was never definitely proved.

Analysis of Cases

Time Distribution.—There were 35 primary cases, and, of these, 30 sickened between Jan. 27 and Feb. 3, a period of eight days: 26 of them sickened in the first five days. The following table shows the dates of onset and admission to hospital.

Date of onset	January					February							Total Cases
	27	28	29	30	31	1	2	3	8	14	15	18	
Cases ..	2	3	4	11	6	1	1	2	1	1	1	2	35

Date admitted	February																Total Cases
	2	4	5	6	7	9	10	11	12	14	16	17	18	20	21	25	
Cases ..	1	3	1	5	4	1	2	1	2	6	3	1	2	1	1	1	35

There were, in addition to the 35 primary cases, six secondary ones in which infection could be traced to one or other of the primary cases. These consisted of 3 clinical cases and 3 symptomless carriers.

It is apparent that the infection must have been distributed on or around Jan. 16. The patient J. P. was isolated on Feb. 20, and there is a strong presumption that he must have been a potential source of infection while working in the shop throughout the whole period up to that date. If he was the cause of the epidemic he must have transferred infection to foodstuffs in large amount during the few days around Jan. 16. The dropping cases towards the end of February can be explained by later infection from J. P. or by a much-extended incubation period.

J. P. was a man of irregular habits who lived in model lodging-houses and was somewhat addicted to alcohol. He was careless as regards his person, and as an example of this he had a large untreated varicose ulcer of some 20 years' duration. He maintained from the first interview that he had no symptoms, and indeed it was with some difficulty that he could be persuaded to give the necessary specimens for examination. On Feb. 20 *B. typhosus* was reported in a sample of faeces, and arrangements were made for his removal to hospital; but even on that day he was at work in the shop, and when interviewed by the medical officer he denied that he was in any way ill. Later in the day, in hospital, it was found that he had a moderate pyrexia and some degree of splenic enlargement. Subsequently he developed bronchopneumonia and died on March 6. Post-mortem examination confirmed the diagnosis of typhoid fever. The spleen was considerably enlarged; Peyer's patches were acutely inflamed and oedematous but not ulcerated. This patient may either have been a carrier who became a clinical case or he may have been an ambulant case somewhere about the middle of January, with a relapse in February. The date of his last attack is not definitely fixed, but, according to the clinical signs in hospital, was probably some time about Feb. 15. The very high titre of his blood agglutination reaction would appear to indicate that his illness following admission to hospital was not his primary attack, although from the end of January right up till Feb. 20 he was seen by a member of the staff of this department and made no complaint as regards his health. Thus, in the absence of definite pointers, no detailed clinical examination was made, but had there been such an examination it might have led to an earlier diagnosis. An important point emerges, however—that in the search for carriers the question of ambulant or relapsing cases should be borne in mind, particularly when dealing with the lodging-house type of patient.

Age and Sex Distribution.—The age and sex distribution of the 35 primary cases were as follows:

Age Group	−1	−5	−10	−15	−20	−25	−30	−35	−40	−45	−50	−55	55+	Total
Males ..	–	2	5	1	2	–	–	2	1	–	–	–	1	14
Females	–	3	3	4	2	–	2	4	1	–	–	1	1	21
Total .	–	5	8	5	4	–	2	6	2	–	–	1	2	35

Although in the early stages of the outbreak women and young children were mostly affected, some adolescent and adult male cases soon followed. The table shows more children under 10 and a higher proportion of women than one would expect in a meat-borne outbreak. It may be that the women and children consumed the ready-prepared meats—the tinned beef and other canned meat products which were sold in the shop by weight—whereas the men were more likely to get the chops and steaks, which, of course, would be cooked at home. It is clear that in investigating typhoid epidemics the age and sex groupings of the early cases may be misleading if the investigator does not maintain an open mind on the consumption of different foodstuffs at different ages. The case for a differential age and sex incidence in milk outbreaks has never been convincing, and any such preconceptions should be discarded.

Secondary Cases.—The secondary cases—i.e., cases infected directly from one or other of the primary cases—numbered 6, but three of these were actually symptomless carriers. The remaining 3 had typical typhoid fever. One of these was a nurse in an infectious diseases hospital. These secondary cases are excluded from the tables so that the description of the epidemic may be confined to infections contracted directly from the butcher's shop.

Family Distribution.—In all, 15 families were involved. In 10 families there were multiple cases: 5 had two cases each, 2 had three, 2 had four, and 1 had five. Thus an exceptionally high proportion of multiple family cases occurred in this outbreak.

Housing and Social Circumstances.—All the cases occurred in 15 tenement houses, 12 of which had two apartments, 2 had one apartment, and 1 had three apartments. The patients were thus all from the poorer working class. As regards spatial distribution, the great majority of the cases occurred in a very circumscribed area surrounding the butcher's shop; but a few arose in distant parts of the town. In the latter, however, direct personal contact was clearly established with the original focus. For example, a woman aged 29 was taken ill on Feb. 2 and was removed to hospital on Feb. 12. Her home address was far removed from the other cases, but she worked in a factory beside one of the patients, whom she visited about the middle of January, partaking of some corned meat.

Clinical Types of Disease

The onset of illness was generally rapid, usually with diarrhoea, abdominal pain, and vomiting. There was, as already noted, an unusually marked tendency for the disease to attack several members in one family. The times of sickening of these cases were often so close together as to raise the question of food-poisoning; and, indeed, 11 of the 35 primary cases were so notified to the department, the diagnosis probably being suggested by the rapid onset. Only in 8 cases was typhoid fever intimated as the probable diagnosis before admission to hospital.

The disease in hospital tended to be severe, and ran the typical course of typhoid. Of the 38 clinical cases admitted (including the 3 secondary clinical cases), 5 terminated fatally—a rate of 13%. Case-to-case infectivity was comparatively low, and none of the patients became a persistent carrier, the usual criteria for dismissal from hospital—namely, three negative faeces and urine examinations—having been satisfied.

Commentary

A meat outbreak of this nature is a comparatively rare occurrence, but with the increasing proportion of canned and processed meats being distributed it is not unlikely that outbreaks spread in this way may become more frequent. The danger lies, of course, in the handling of preparations which are usually eaten without further cooking, such as corned beef, pressed beef, and canned meats of various kinds, the cans being opened within the retailer's premises and the meat sold by weight in small quantities over the counter. Cooked meats sold by retailers may also be infected. But even meat and meat products which are usually cooked in the home are now exposed to much-increased handling in distribution, and this in itself may constitute an added danger. The sausage particularly is suspect, because it is doubtful if, in cooking, its centre always reaches a very high temperature.

The meat which was the vehicle of infection was heavily infected for a few days in the middle of January. When the patient J. P. was found to have *B. typhosus* in samples of faeces and urine it was naturally concluded that he must have been the source of infection. He was employed almost entirely in the back shop, cutting up carcases into joints, etc., for sale over the counter. He did not normally handle canned meat, nor did he serve customers, but is said to have done so on occasion. He was by reason of his personal habits a very likely type of man to convey any infection he may have had to whatever he handled. Unfortunately for the complete acceptance of this theory, shortly after admission to hospital he was himself discovered to be a case of typhoid fever, dying later of a pulmonary complication, the active typhoid being confirmed by post-mortem examination. Therefore, if he is to be regarded as the source of the outbreak we are driven to put forward the two possibilities already mentioned—that he was a chronic carrier who developed clinical disease, or that he had had an ambulant attack of typhoid with a clinical relapse. On the other hand, he may simply have been infected in the same way as all the others, in which case the source of infection must remain unknown. No cases occurred through infection from the shop during the period when he was known to carry typhoid bacilli—namely, the few days prior to Feb. 20. His discovery as an actual or probable source of infection was thus made after the epidemic was over, and no further cases have arisen from this focus up to the date of publication.

With regard to the sending out of circular letters to practitioners warning them of the existence of typhoid fever; while this may be of considerable value, it should not be allowed to take the place of a house-to-house visitation and search for cases, particularly if the outbreak is localized. Many cases of illness in the area were thus traced to infectious disease hospitals and to wards of general hospitals, having been admitted with a diagnosis of pneumonia, influenza, cerebrospinal fever, or enteritis. In fact, as mentioned already, only 8 were actually sent to hospital as typhoid fever. The active search for cases presumably had its reward in the small number of secondary infections.

In this outbreak the first five families had the same milk supply, and although they dealt with the same butcher no particular kind of meat appeared to have been consumed by all cases. Furthermore, the butcher's clientele was far wider than the dairyman's. Suspicion at first therefore rested on the dairy, and although general supervision was exercised over the butcher's shop, bacteriological investigation was at first confined to the dairy staff. Other cases continued to arise from the same milk supply, and even in instances where the milk supply was stated to be from another source, one could not be sure that casual purchases from the suspected dairy had not been made. After an exhaustive examination of the milk supply had yielded entirely negative results, more detailed attention was directed to the butcher. He had at first not been too co-operative, but finally he and his staff provided all the specimens required. By this time, however, it was evident that the peak of the outbreak was past. The butcher probably had about 2,000 rationed customers. Thus the maximum risk to these customers, among whom 35 primary cases occurred, was 1.75%.

The exceedingly low standard of hygiene and general cleanliness in the butcher's shop must also be commented upon. It is feared that such conditions are common in the poorer quarters of towns. It may be remarked, too, that shortage of good-quality skilled labour and other difficulties are matters of concern at the present time.

JAUNDICE PRESENTING UNUSUAL FEATURES

BY

A. M. GILCHRIST, M.B., Ch.B.
Surgeon Lieut., R.N.V.R.

Four cases of jaundice coming under observation at a Naval hospital within a very few months presented unusual features. The pathological reports upon material removed at operation from the liver of two patients with "subacute hepatitis" constitute a valuable addition to the case records; the following is the story of "four instructive mistakes."

Case I. Jaundice due to Subacute Hepatitis: Exploratory Laparotomy: Recovery

An officer aged 24 was suddenly seized with acute abdominal pain at the end of Jan., 1942; it was fairly generalized, but the maximal intensity was in the epigastrium. The pain was colicky, and came on in spasms, which "doubled him up" and were followed by intervals of comparative freedom, although a dull ache persisted between the "spasms." This first attack lasted about 12 hours, but was not associated with vomiting; the pain gradually wore off. For nearly two months after this attack the patient had little appetite, felt "out of sorts," and experienced occasional pain of moderate severity in the upper abdomen. During early April a second stage may be said to have begun with frequent severe attacks of abdominal pain at night; there was no radiation of pain to the back or lumbar region. His urine was dark in colour and his skin and conjunctivae looked slightly yellow; there was no pruritus.

His general condition deteriorated, and on admission to a Naval hospital for further investigation the jaundice was marked and of a deep yellow colour; all pain had now disappeared. He was considerably emaciated, but cheerful and optimistic in outlook. Severe persistent headache and dimness of vision were other symptoms; at no time was there any vomiting, although nausea was complained of occasionally after meals. The liver was slightly enlarged and tender; the gall-bladder could not be felt: the spleen was not palpable. The tongue was furred; the teeth were good, but there was considerable sponginess of the gums, which bled on the slightest pressure. No enlargement of glands in axillae, neck, or groin was found. The urine was dark and contained bile pigments and bile salts.

A direct van den Bergh gave an immediate positive reaction. Quantitative indirect gave 7.2 mg. (14.4 van den Bergh units). Paul-Bunnell test was negative. Blood picture: R.B.C., 4,550,000; Hb, 86% (Haldane); C.I., 0.95; leucocytes, 5,200—polymorphs 45%, lymphocytes 45%, large mononuclears 5%, eosinophils 2%, mast cells 0, basophils 0; B.S.R. (Westergren), 11 mm. in 1 hour, 22 mm. in 2 hours; Wassermann, negative. Radiographs revealed no opaque calculi. The pulse was regular about 80; temperature showed a slight evening rise. The past history disclosed nothing of significance. He had never served outside British waters.

The clinical picture was not characteristic of any of the more frequent types of jaundice, but the most probable diagnosis appeared to be an obstructive jaundice due to cholelithiasis. The prolonged jaundice was considered to necessitate an exploratory laparotomy. After the liberal administration of glucose and vitamin K, operation was performed on April 21. The liver was moderately enlarged, but its surface smooth and its outline even; nothing abnormal was seen in the appearance or texture of the gall-bladder. No gall-stones could be felt in gall-bladder or ducts. An enlarged lymph gland was found near the cystic duct, and two more were easily palpable along the common bile duct, but it was obvious that these two glands were not obstructing the flow of bile; the lesion was evidently intrahepatic. Two of the lymph glands were removed for microscopical purposes and a small portion of liver was also resected. Bleeding at the operation was minimal.

Pathological Report (Dr. W. W. Woods).—"*Subacute hepatitis*: There is severe albuminous and vacuolar degeneration of the liver cells, their cytoplasm being swollen, coarsely granular, and vacuolated, and their nuclei showing karyolysis. In frozen sections sudanophil fat can be found in only a few scattered cells. Disappearance of a few liver cells as the result of necrosis has occurred in the centres of the lobules, where there is conspicuous dilatation of the sinusoids. There is bile pigmentation of the liver cells, but there are only a very few bile thrombi in the canaliculi. Regeneration of parenchyma is indicated by many cells with two nuclei, some of them having deeply eosinophilous cytoplasm; only one mitotic figure can be found. Inflammatory infiltration is almost confined to the portal systems, extending thence only slightly between liver cells. It is more severe in the smaller than in the larger portal systems. It consists of numerous lymphocytes, a few eosinophil leucocytes, and very few neutrophil leucocytes. There has been slight proliferation of fibroblasts, but there is no fibrosis. The bile ducts are normal and empty. In the lymphatic glands from the region of the cystic and common bile ducts there is a pronounced degree of hyperplasia of the endothelial cells of the lymph sinuses (sinus catarrh)."

Post-operative progress was uneventful. Glucose was given freely, and occasionally small doses of calomel and magnesium sulphate. The jaundice began to diminish as the general condition improved, and six weeks after operation had entirely disappeared. The officer was ultimately sent on sick-leave.

Case II. Jaundice due to Subacute Hepatitis: Exploratory Laparotomy: Death Two Months after Operation

An officer aged 34 complained in Aug., 1940, of a sensation of fullness in the abdomen, flatulence, loss of appetite, and general debility, present for some weeks; no previous history of any similar illness. He was jaundiced, the icterus being of moderate intensity. The abdomen was somewhat distended, the distension being uniform; the liver could be palpated beneath the right costal margin.

After several weeks, during which the jaundice increased somewhat in intensity, he was admitted to a Naval hospital. By this time jaundice was marked, and the patient listless and disinterested; he had lost much weight, and his appetite was poor. The abdomen was distended, tumidity being most pronounced in the right hypochondrium, the musculature of which showed some rigidity. The liver was enlarged, and its lower border was felt three finger-breadths below the costal margin; the outline appeared fairly regular, and there was tenderness on pressure over it. The gall-bladder was not palpable: no enlargement of spleen or kidney could be detected. The glands in the groin, axillae, and neck were not involved. Rectal examination yielded no positive information of value. The urine contained bile salts and bile pigments.

Faeces were slate-grey in colour; total fats 64.48 g.%—neutral fats 2.8%, soaps 36.68%, free fatty acids 25%; no pathogenic bacteria, cysts, or ova. A blood count showed: R.B.C., 4,110,000; Hb, 88% (Haldane); C.I., 1.08; leucocytes, 6,800—polymorphs 51%, lymphocytes 43%, large mononuclears 4%, eosinophils 2%. Slight anisocytosis and achromia were noted. Fragility of red cells, bleeding time, and coagulation time were within normal limits. The van den Bergh gave an immediate direct reaction. The laevulose-tolerance test showed no impairment of hepatic efficiency. The Wassermann reaction was negative on several occasions. A straight radiograph showed no opaque gall-stones. The gall-bladder was not seen by opacol radiograph. No calculus or other abnormality seen. The patient stated that during the previous 6 or 8 months while serving in small ships he had frequently been exposed for two or three hours daily to acetylene fumes in his cabin. However, no others exposed to similar fumes had reported sick.

The hope still lingered that the case might be one of "catarrhal jaundice," and initially in hospital the patient was treated expectantly by glucose, fat-free diet, and an occasional dose of calomel and magnesium sulphate. His condition, however, steadily declined; his appetite and weight decreased, and his jaundice became more intense. The possibility of a neoplasm involving the main bile channel now obtruded itself more and more menacingly: exploratory laparotomy was considered necessary. At operation the liver was found to be much enlarged and of firmer texture than normal; here and there the organ showed definite scarring, and a definite thickening could be felt in the portal fissure. The gall-bladder was of small size, whitish, and *quite empty*. The common hepatic and bile ducts were not dilated, and the obstruction was obviously above the junction of the hepatic and cystic ducts; the thickening in the portal fissure seemed to localize the obstruction to the very commencement of the extrahepatic canals. The spleen was not enlarged. A wedge of liver tissue was removed for microscopical examination. The findings at operation suggested either a malignant growth in the portal fissure or a syphilitic hepatitis despite the negative Wassermann reaction. Further serological tests also proved negative.

Pathological Report (Dr. W. W. Woods).—"*Subacute hepatitis with portal fibrosis*: The portal fibrosis is of a subacute, active, recent type. Thus the portal systems in every lobule are uniformly enlarged by a rarefied oedematous network of thin and thick collagen fibres and moderately numerous, rather slender fibroblasts. They are infiltrated with numerous lymphocytes, remarkably numerous neutrophil leucocytes, a few round and spindle macrophages full of bile pigment, and a few plasma cells. There is considerably less inflammatory infiltration in the large portal systems than in the small. This infiltration has spread between the liver cells of the periphery of the lobules. These inflamed fibrotic portal systems contain numerous regenerated pseudo-bile canaliculi, which seem to have budded out from the liver cells; they contain much bile pigment, mostly in their lumina, some in the cytoplasm of their cells. The fibrosis is unilobular. There has been no nodular regeneration of liver cells to disturb the normal lobular pattern. Regeneration of single cells is indicated by the presence of two nuclei in some cells. There is albuminous degeneration and vacuolation of liver cells, and the nuclei of many show karyolysis. In one group of liver cells vacuolation is conspicuous. In the absence of frozen sections the presence of fat cannot be determined. In the centres of the lobules there is slight inflammatory infiltration. There is much bile pigment in the liver cells, and large bile thrombi are numerous in the bile capillaries. The bile ducts in the small and large portal systems are not dilated and are empty except for a very little coagulum in one of the larger ducts. All arteries and veins are normal."

The patient recovered from the immediate effects of the operation, and some two weeks later was able to get up and walk about. However, he subsequently relapsed, and increasing debility and progressive emaciation necessitated his return to bed. Jaundice steadily increased, and ascites developed so that regular paracentesis had to be employed to relieve the abdominal distension. Death occurred about 2 months after the laparotomy.

Comment on Cases I and II

Clinical jaundice readily suggests the three most frequent groups of cases characterized by this arresting symptom, and attempts were made to assign the patients to their particular category: (*a*) catarrhal jaundice; (*b*) the effects of cholelithiasis; and (*c*) malignant obstruction of the extrahepatic biliary channel. In both of the above cases an erroneous pre-operative diagnosis was made, but material removed at laparotomy led to the diagnosis of subacute hepatitis from the pathological laboratory. The term "hepatitis" suggests vagueness of diagnosis, since it may include all the results of damage to the liver, chemical or physical, or due to the action of micro-organisms and their toxic products. It might also include the various processes of reaction and repair which follow the injury. Unfortunately, in these two cases the precise cause of the hepatitis is still wanting.

It must be most exceptional in a case of hepatitis to have the onset of the disease heralded by symptoms of such severity as to suggest gall-stone colic. The persistence of the jaundice which followed the last attack of severe pain in Case I seemed to demand surgical investigation and some operative effort to relieve the obstruction. The absence of any gross obstruction along the course of the extrahepatic ducts occasioned the greatest surprise.

The pathological diagnosis of a hepatitis suggests some relationship to so-called "catarrhal jaundice," in which severe pain certainly never occurs. Doubtless both conditions are due to an infective agent, and recent investigation into the cause of catarrhal jaundice tends to demonstrate the infectivity of the disease and its possible spread by droplet infection (Newman, *British Medical Journal*, 1942, **1**, 61): many cases have been found in a locality among individuals living together or spending their lives in fairly close contact, but in our case the officer was certain there had been no similar cases among his colleagues. He gave no history suggestive of gastro-duodenal catarrh as the early pathology of the condition. The pathological findings are of unusual interest because of the rare occurrence of a biopsy of liver tissue in this disease and because of the severe degeneration of the liver cells seen in section, amounting in some areas to a complete atrophy.

In Case II the absence of pain, the increasing jaundice, and the emaciation suggested the possibility of a neoplasm, and an exploratory laparotomy seemed to be indicated. The fibrotic changes and scarring in the liver seen at operation raised the question of a syphilitic infection, but serological tests negatived this suggestion. The spleen was only slightly enlarged, and detached blood examination excluded any of those blood dyscrasias associated with gross splenic and hepatic enlargement with cirrhosis. The whole pathological process was intrahepatic; and the hepatitis was considered to be toxic in origin, the identity of the actual toxin remaining obscure. The patient had volunteered the information of his exposure to acetylene fumes while asleep in his cabin, adding how listless and unrefreshed he felt in the morning. However, no reference in the literature could be discovered relating to acetylene as producing hepatitis with jaundice; but whatever the toxin was, its virulence was demonstrated by the unfavourable course of the illness and its fatal termination.

Case III. Jaundice due to a Mass of Lymphadenomatous Glands compressing Main Bile Channel. A Case of Hodgkin's Disease, Rapidly Fatal

An officer aged 27 was admitted to hospital in March, 1942, with a history of increasing jaundice of about 10 weeks' duration. He complained of loss of appetite, constipation, and general debility; about 7 days later jaundice appeared, and he was treated by a light fat-free diet, glucose, and abundant fluids. No improvement took place, and 6 weeks later an indefinite swelling, thought to be a distended gall-bladder, was felt in the right hypochondrium. A straight radiograph showed a vague opaque shadow which suggested a gall-stone. Further facts were now elicited. At no time had he any pain—only a feeling of intermittent discomfort in the abdomen; there was no history of digestive trouble, and no similar cases had occurred among his colleagues. He was losing weight rapidly. Early in 1940 he had suffered from pleurisy, but his recovery was apparently complete, and full investigation had suggested no possibility of persistent tuberculous infection.

When admitted to hospital he was deeply jaundiced and emaciated. The liver was slightly enlarged and could be felt beneath the costal margin, but a movable swelling was now easily felt in the right hypochondrium, extending down to the right iliac fossa, and not continuous with the liver margin; this appeared to be a distended gall-bladder. Neither the kidneys nor spleen were palpable. One rather large discrete solitary gland was felt in the right supraclavicular fossa; this was not tender, and was not attached to the skin or deeper structures. No glands were palpable in the axillae; and those in the groin were within normal limits. No abnormality was detected per rectum. Almost the whole of the body was covered by a diffuse rash, produced by constant scratching due to the intractable itchiness of the skin. The urine showed no abnormality except bile salts and pigment and a faint trace of albumin. R.B.C., 4,050,000; Hb, 80% (Haldane); C.I., 0.9; leucocytes 7,000—polymorphs 65%, lymphocytes 20%, large mononuclears 4%, eosinophils 1%, mast cells 0. Wassermann reaction negative. A direct van den Bergh gave an immediate positive reaction; quantitative indirect, 20 mg. (40 van den Bergh units) per 100 c.cm.

A second straight radiograph a week after admission showed a shadow to the right of the ascending aorta in an antero-posterior view of the chest. The cervical gland enlargement was considered to be either secondary to some intra-abdominal neoplasm or, alternatively, of lymphadenomatous nature. The biopsy pathological report was provided by Dr. I. Doniach, pathologist to Mount Vernon Hospital, who reported: "The architecture of the gland is destroyed by a reticulum-cell hyperplasia. Scattered throughout are numerous giant cells of the Dorothy Reed type, together with a good number of lymphocytes, eosinophils, and plasma cells. The cells have laid down only a moderate amount of collagen. Fairly numerous mitotic figures were observed. The picture is typical of Hodgkin's disease." Within a month the patient's condition was miserable in the extreme. The pruritus had become much worse, and sleep was impossible without large doses of sedative, morphine frequently being necessary. Although the prognosis appeared hopeless, and further blood counts showed a progressive anaemia, it was considered desirable to perform a cholecyst-gastrostomy in an attempt to relieve the pruritus.

At operation, on April 4, the gall-bladder was greatly distended, and rather more than half a pint of fluid was aspirated before the anastomosis was done. Examination of the fluid revealed no bile pigment and only a trace of bile salts; cholesterol was found in the merest trace. A large mass of glands was felt in the portal fissure and along the common bile duct. The spleen was enlarged to about twice normal. The anastomosis was rapidly completed and the abdomen closed. The patient failed to rally from the operation and died the following day.

At the time of the patient's admission to hospital the diagnosis was fraught with less difficulty than that which obtained at the onset of the illness. The progressive painless jaundice associated with an enlarged liver, the considerable distension of the gall-bladder, the enlarged gland in the right supraclavicular fossa, and the gradual emaciation strongly suggested a sinister cause of bile-duct obstruction. The biopsy proved the cervical gland to be lymphadenomatous, and the laparotomy deemed necessary by the severe pruritus gave evidence of the rare nature of the obstruction to the main bile channel.

There are certain unusual features about this case. Death indirectly due to cholaemia from obstruction to the main extrahepatic bile channel by a mass of lymphadenomatous glands is exceptional, although Rolleston and McNee do make reference to the possibility of compression of the chief bile channel by such a mechanism. These authors note that jaundice is infrequent in lymphadenoma, but allude to possible glandular compression of the common duct; they also mention two cases of periodic jaundice in Hodgkin's disease, the jaundice coinciding with fever and enlargement of superficial lymphatic glands. In Hodgkin's disease it is most exceptional for the clinical picture to be dominated by obstructive jaundice and its consequences; the rapidity with which these hastened the fatal ending of the case contrasts with the natural history of the malady: in 15 weeks from the first symptom the disease had proved fatal. The case presented other atypical features: the lymphatic glandular involvement was far less widespread than usual; one discrete enlarged lymphatic gland palpable on the right side of the neck, and the existence of a possible second in the posterior mediastinum demonstrated by radiograph, constituted the only evidence of the disease. The operation performed to relieve the pruritus enabled us to discover a glandular mass in the portal fissure which had produced the jaundice; further, the lymphatic involvement was more or less confined to those glands. It will be recalled that this patient was investigated after pleurisy some 18 months previously, and although no evidence of active tuberculous disease was found, the theory of the possibility of a coexistence of the two maladies or even of their causal relationship is revived.

Case IV. Calcified Mass embedded in Head of Pancreas compressing Lower End of Common Bile Duct: Removal: Recovery

A stoker aged 49 was admitted to a Naval hospital with 4 months' painless jaundice. An enlarged liver and a distended gall-bladder suggested a growth obstruction of the choledochus. A two-stage operation was done after taking pre-operative measures. At the preliminary cholecyst-gastrostomy a firm lump could be felt near the lower end of the common bile duct, and the pre-operative diagnosis of an "ampullary carcinoma" seemed to be confirmed. At the second operation the mass was found embedded in the head of the pancreas, and was removed with some adjacent pancreatic tissue by a retroduodenal approach. The choledochus was seen to be compressed but not infiltrated, and was not injured during removal of the "tumour."

The pathological material proved to be a mass of agminated calcified tuberculous glands. Surgeon Rear-Admiral Gordon-Taylor, who operated on the case and recently reported it, remarks: "There was perhaps some justification for the mistake in diagnosis, but at least the patient is to be congratulated on the pathological nature of the compressing mechanism, which before this experience I might have seriously doubted."

Summary

Four cases of jaundice have been described in which a diagnosis based on careful clinical examination, reinforced by laboratory and other investigations, was proved by operation to be inaccurate. The experience and knowledge to be gained from them appear to act as a deterrent, and to justify restraint on the practitioner who feels confident in his capacity to assign correctly to a particular category any case of jaundice on clinical grounds alone. The descriptions given above demonstrate that although the cases had not a few features in common, nevertheless the exact pathological detail obtained as the result of operation proved that the morbid process varied greatly. Specific infectivity, toxicity, granulomatous disease, could all be considered in the course of diagnosis. It is also worthy of note that despite our surprise in being able to exclude malignant neoplasm on three occasions (Cases II, III, and IV), yet in two of these (Cases II and III) the disease ran a fatal course in a comparatively short period. Case IV claims special mention in being apparently illustrative of its author's hope that palliative treatment for neoplasms in the region of the pancreatic head may sometimes be replaced by radical surgery, offering a reasonable prospect of cure.

I wish to express my thanks to the medical officer in charge of this hospital for permission to publish this communication and for the facilities which he constantly offered me in the collection of case details. My acknowledgments are also due to Dr. W. W. Woods, Consulting Pathologist to the Navy, and to Dr. I. Doniach for the pathological reports

DEFICIENCY DISEASE AND ACADEMIC EVIDENCES OF SUBNORMAL VITAMIN METABOLISM

BY

R. E. WRIGHT, C.I.E., M.D., M.Ch.(Hon.), D.P.H.

Major (T.), I.M.S.

The present war with its food restrictions and black-out conditions inevitably focused attention on vitamins throughout Great Britain. Interest in the essential food factors, which was extensive before the war, flared up in both academic and trade circles. Eventually, through the media of the medical and general press and official and unofficial propaganda by circular, screen, and air, the public and the profession became almost hysterically vitamin-minded.

In certain directions there was a complete loss of perspective, incompatible with an emergency which demands a realistic view of the practical issues at the fighting fronts over-seas, and conservation of academic energy at home for more essential problems. In fact, the cult of vitamin deficiency both here and in the U.S.A. has become in part a racket. This state of affairs is largely due to the premature booming of experimental observations, and the attempt to fit them into the jigsaw of human physiology, psychology, or pathology as the case may be. The clinician is not blameless. He lends support to the situation by the empirical use of proprietary vitamin products in all manner of affections and in acclaiming their value by *post hoc* argument. However important the study of vitamin deficiency, the application of academic findings to the maintenance of fighting efficiency should be discussed at a level compatible with total war. Such discussions can hardly be conducted in perspective by those who have no first-hand experience of the clinical aspects of the vitamin deficiency disease syndromes as they exist in man and of the conditions appertaining at the various fronts. Yet just now probably more attention is given to theoretical considerations in this connexion, both here and in the U.S.A., where the clinical picture of frank vitamin deficiency disease as it appears in man is familiar to few, than in parts of the world—such as China, Russia, India, Africa, and Japan—where the human manifestations constitute a familiar everyday problem, the practical economic importance of which is great but subordinate to more urgent issues.

General statements such as these demand at least some support. Let us take the case of night-blindness in vitamin A deficiency.

Vitamin A Deficiency and Night-blindness

Night-blindness, better referred to for psychological reasons as "hemeralopia," is a prominent symptom of A-deficiency disease. It is the only subjective symptom until the later stages of the disease syndrome. This syndrome constitutes an important ever-present economic health problem in large population groups in various parts of the world, such as in the above-mentioned countries.

Frank predominant vitamin A deficiency disease is common in the Madras Presidency, which has a population bigger than that of England and Wales. Its manifestations differ in children and adults or, as Frazier and Hu (1934) have suggested, in the pre- and post-puberty periods. I have for years urged that it is the greatest cause of preventable blindness in children in South India on account of the associated corneal metaplasia or keratomalacia (Wright, 1931, 1937). The latter term is commonly used for convenience throughout the Far East for the whole syndrome, which emphasizes the importance of this complication. The most common sign, and possibly the earliest clinical evidence, of this syndrome is smokiness of the conjunctiva. This is my own view, and might possibly be disputed by such experienced clinical observers as Frazier or Pillat. I formerly held that night-blindness was the earliest evidence of keratomalacia (Wright, 1934). This conjunctival sign is unrecognized or not considered worthy of mention by those who discuss the effects of vitamin A deficiency in this country, probably because few of them have ever seen the disease as it exists in man. Kirkpatrick (1936) mentions it. It is well recognized in China (Mu *et al.*, 1937). It is not referred to by Nicholls (1938) of Ceylon: this is hardly because he does not recognize it, as it has been known to medical men in his part of the world for years, but because both he and Aykroyd—in South India—have found it more convenient to use "phrynoderma" (pilosebaceous hyperkeratosis) in their surveys. Among children of the poorer classes Aykroyd and Rajagopal report a frequency of phrynoderma of 14% for certain groups in South India. Smokiness of the conjunctiva would probably give a higher frequency and might well be a better index. There are in the museum of the London School of Tropical Medicine water-colour pictures of this condition which I had copied years ago from some of my pictures in the museum of the Government Ophthalmic Hospital, Madras: these give an idea of its appearance. Whether this sign or the symptom of night-blindness is the earliest or most common manifestation of A-deficiency is beside the point. We have no adequate frequency figures for either to guide us. Chou (1930) has reported normal dark-adaptation in 7 out of 20 patients with early ocular signs (pigmentation) of vitamin A deficiency. The important thing for purposes of this communication is that either may be absent in cases which are otherwise clinical examples of frank predominant A-deficiency. This fact as regards the symptom is sufficient in itself to show what a false emphasis has been placed on the connexion between vitamin A metabolism and variations in night-vision here since the war began.

In discussing experimental photometric methods employed to demonstrate a correlation between defects of dark-adaptation and the so-called subclinical A-deficiency, Frazier and Li (1938) quote Jung (1938) on the applicability of the fallacy of centripetal drift to the conclusions from such observations. They say: "It would seem, therefore, that a more critical evaluation of the results of photometric testing is required before final conclusions can be drawn on either the incidence of subclinical forms of vitamin A deficiency or the effect of therapeutic measures on the results of such tests. For the present, at least, evaluation of specific treatment in human cases should depend upon observations on definite clinical manifestations such as straightforward night-blindness, xerophthalmia, and follicular hyperkeratosis of the skin." This criticism seems as pertinent to-day as in 1938, and the application of Jung's ideas on poor dark-adaptation to recent work in this country would probably show that in "conditions influenced by so many uncontrolled variables the readings are completely determined by chance."

Again, this night-blindness does not constitute a labour problem in South India, where A-deficiency is so prevalent. It does not interfere with night work to any extent. I have rejected more candidates for specialized night employment, which required a simple night-vision test, on account of tapetoretinal degenerations, of which retinitis pigmentosa is chief, than for the hemeralopia of A-deficiency. In either case the figure is so small as to be insignificant. Night-blindness, too, does not prevent such jungle tribesmen as the Sholagas of South India moving rapidly and safely through dangerous country on the darkest nights. I have followed such men, some of whom showed evidences of A-deficiency, in the dark with difficulty.

If a case of A-deficiency disease with well-marked night-blindness in a Tamil received the average daily ration of the British soldier in England once a week, I should expect recovery. The authorities here at home would shudder at the thought of maintaining the British soldier on a diet which in hospitals of South India or parts of China or Japan would be considered adequate to keep the individual free from hemeralopia. As I have indicated elsewhere (Wright, 1935-6), I cannot imagine there being any such thing as a practical vitamin A deficiency disease problem in this country or America on diets short of famine diets.

With regard to the anti-infective role of vitamin A—which may yet have a revival in connexion with the home Forces—I agree entirely with Pillat (1929) that ordinarily the pathogens grow as saprophytes in the metaplastic tissues of vitamin A deficiency disease; and with Kirkpatrick (personal communication), who holds that colliquative necrosis is the primary process which produces corneal ulceration, not an invasion by pyogenic organisms. My experience coincides with that of Frazier and Hu (1936), that an increased susceptibility of the skin to "boils, sores, impetigo, napkin rash, or other evidence of skin sepsis" is not a clinical feature in keratomalacic subjects. Skin rashes other than pityriasis pilaris (pilosebaceous hyperkeratosis) are not more common in the keratomalacic population of Madras than in the general hospital population (Nayndu, 1935).

Evidently the condition in man cannot be gauged from observations on animals so far as practical clinical issues are concerned. If they were even approximately parallel, an increased frequency of stone in the bladder might be assumed to exist in South India by those in this country interested in vitamins but without experience of the A-deficiency disease syndrome in man. To find an increased frequency of stone in India one must look in parts of the North, where vitamin A deficiency disease is hardly known.

Night-vision in the Army

Before assuming, on theoretical academic considerations or animal (and human) experiments, that minor degrees of A-deficiency affect in any practical way whatever the military value of our man-power in this country, it is essential to consider the effects of gross A-deficiency on the physical activities of members of those populations largely afflicted with vitamin A deficiency disease. Apparently night-blindness has not interfered with the rapid night movements of Japanese troops through the Malayan jungles, although prima facie one might expect it to be a more practical difficulty in their case. Undoubtedly we have a night-vision problem here now. Modern methods of war have enhanced the value of good night vision and thrown poor dark-adaptation into prominence.

For convenience we may consider poor dark-adaptation as of three types—psychogenic, pathogenic, and physiogenic.

Psychological disturbances are a frequent and serious cause of poor night-vision in the Army, as pointed out last year in these columns (Wittkower *et al.*). This form of psychoneurosis received a considerable impetus from the ill-advised publicity campaign in connexion with the beneficial effects of vitamin A on night-vision. The evil effects of this campaign are enormous; the term "night-blindness" has attained a suggestion-value analogous to that of "shell-shock" in the last war.

Bad night-vision associated with well-known recognizable pathological ocular conditions is infrequent and of lesser moment. In this *pathogenic* group the night-blindness of vitamin A deficiency would find a place if it existed here. In the *physiogenic* group poor night-vision may be regarded as a variation in dark-adaptation at one end of the physiological curve. That this function is influenced by many factors, individual and racial, is known. Its investigation is essential in connexion with certain activities of the fighting Forces, and is having the serious attention of the medical authorities. It is not a vitamin A problem, and will not be solved by "following the carrot."

Vitamins B and C

Criticism in like manner is applicable to recent activities in connexion with B complex and vitamin C. To assess deficiency in B_2 (riboflavin) mainly by means of minor variations in the capillary loops at the corneal margin—which are, to say the least of it, common to a number of causes—is futile in wartime. Yet Sydenstricker *et al.* (1940) seriously advocate such capillary changes as the main prop in a list of clinical criteria.

Among ophthalmologists familiar with corneal bio-microscopy since its inception, who is to say what are the capillary variations at the limbus within normal limits? Does the capillary invasion which is suggested as a criterion exceed that which is determined by dust, wind, weather, and other irritants associated with military activities? When a vitamin deficiency can be assessed quantitatively by chemical means, and a biochemical (subclinical?) abnormality established, it may be justifiable in wartime to subject large numbers of hard-worked officers and men to detailed examinations—provided competent clinical, public health, and pathological opinion can show a probable case for impairment of military efficiency on metabolic grounds. Even here a practical rather than an academic level should be adopted.

The processes of biological oxidation (cell respiration) with which the vitamins are eventually concerned are interdependent and overlap, just as the clinical evidences of deficiency overlap. This fact necessarily leads to important abstruse fields of chemical inquiry. Such investigations, and mass biochemical observations, especially on children, will no doubt afford information which may be of use in post-war reconstruction. This war has still to be won by, for the most part, adults to whom the application of metabolic hypotheses is hardly of military value, as they must fight now under dietetic conditions largely imposed by the enemy.

Finally, in this matter of vitamins as applied to the supply of man-power in a grave emergency here and in the U.S.A., it is out of perspective and unrealistic to spend time, money, and energy by labouring academic findings when at least the younger observers may get in touch with practical issues by looking further afield and seeing the real thing in greater mass as it exists in man under conditions of total war over-seas.

Medical Memoranda

A Case of Haemorrhagic Measles

While it is generally agreed that haemorrhage occurring into a measles rash is not uncommon, true haemorrhagic measles is so rare that well-known writers on infectious diseases such as Goodall and Ker state that they have never seen a case. It is thought that the more frequent reference to it by the older writers was due to its confusion with haemorrhagic small-pox. For this reason I think that the following case, though not quite typical, is worthy of publication.

The patient, a male child of 12 months, was seen at home on June 9, 1942, by Dr. Myerhoff, who considered the appearance to be typical of measles in the eruptive stage. The rash had started on the previous day. On the 12th the child became very ill and was admitted to Clayponds Isolation Hospital as a case of measles complicated by bronchopneumonia.

On admission the child, who was of normal nutrition and development, was seen to be very collapsed and dyspnoeic. The rash had completely disappeared. Although dyspnoea and cyanosis were severe—respiration rate 70—the chest was free from abnormal physical signs. The patient's condition at this stage would seem to correspond with the suffocative type of measles described by Rolleston and Ronaldson. The child was given 0.5 g. of sulphapyridine 4-hourly, continuous nasal oxygen, and frequent glucose drinks. About 4 hours after admission extensive haemorrhages into and under the skin of the face and limbs suddenly began to develop. One large haemorrhagic area, involving the greater part of the nose and adjoining skin, had a raised bullous appearance. No bleeding occurred from the mucous membranes, and the skin haemorrhages had reached their maximum extent in the course of a few hours. Subsequently the general condition of the child began to improve, but he remained very ill, with an irregular remittent temperature, for a further nine days. Sulphapyridine was discontinued on June 16 and no further complications occurred. Subsequent convalescence was rapid, and the patient was discharged from hospital on July 1. The haemorrhagic appearance had by then completely disappeared except for the presence of a scab on the bridge of the nose, where a large haemorrhagic bulla had resulted in superficial ulceration.

This case appeared to correspond with the description of true haemorrhagic measles in that there was a rapid recession of the rash followed by haemorrhagic extravasation. It differed in the absence of haemorrhages from the mucous membranes and in its ultimate recovery.

I am grateful to Dr. Thomas Orr, medical officer of health for Ealing, for permission to publish this case.

J. J. LINEHAN, M.D., D.P.H., D.C.H.,
Resident Medical Officer, Clayponds Isolation Hospital.

Reviews

PAIN AND ITS MECHANISM

Pain. By Sir Thomas Lewis, M.D., F.R.S. (Pp. 192; 27 figs. 12s. 6d.) New York and London: The Macmillan Company. 1942.

Bacon wrote of books, "Some are to be read only in parts; others to be read but not curiously, and some few to be read wholly and with diligence and attention." Sir Thomas Lewis's *Pain* belongs to the third category. As a clear, exhaustive, and critical exposition it is a worthy successor to *The Mechanism and Graphic Registration of the Heart Beat and Blood Vessels of the Human Skin and their Responses*; while its content will appeal to the wider audience of practitioners and students already familiar with *Diseases of the Heart* and *Vascular Disorders of the Limbs*. The scope of the book can be gathered from two extracts from the preface:

> "The chief purpose of this book is to review modern ideas of the mechanism of human pain and to bring into perspective with other observations the work of my own laboratory during the last ten years. While attempting to make a book of reference, one that will bring contact with the more important views, I have desired to . . . keep it in a readable form that will stimulate interest and enquiry."
>
> "Our knowledge of pain, of its sources, of the nerve paths conveying it, has been built up, and will continue to be built up, chiefly by observations upon man. It is built up by tests of the sentient surface in the normal subject, tests of skin deprived deliberately or accidentally of its nerves, the innumerable probings of disease itself, stimulation of deep-lying structures during surgical operations, and ingenious forms of exploration of deep structure from without; all these sources have contributed so abundantly that I shall but rarely need to refer to evidence derived from animals. There is manifest wisdom in seeking knowledge from the direct, rather than from the indirect, source, and here the direct source is prolific; there is, too, the deep satisfaction of knowing that any evidence won from man is indubitably applicable to the human problem."

After reviewing the sensitivity of various human tissues to pain and the nervous paths subserving it, the author proceeds to unfold, against the background of earlier knowledge, the newer developments resulting from his own work and that of his laboratory. This begins with the demonstration that in respect to quality there are but two distinct kinds of pain, that arising from skin and that arising from deeper structures. Dealing first with skin pain the author describes the condition "erythralgia," in which the skin some hours after being injured by a variety of stimuli becomes red and tender. An analysis of this condition leads to the conclusion that the hyperalgesic skin "is one which has been brought to this state by the action of certain tissue substances upon the pain nerve-endings, the latter being rendered hyper-excitable." The next chapter analyses the diffuse hyperalgesia which follows a few minutes after a small localized severe injury to the skin and which may last for 8 to 12 hours or as long as two days. An experimental analysis shows that this hyperalgesia is due to an axon reflex arising from the point of injury and spreading to the limits of the area involved, where the effector endings release in the skin substances increasing the excitability of the pain nerves. Since this axon reflex implies unusually long axonic branchings, and since the effector release of substances lowering the pain threshold cannot be ascribed to any known system of nerves, the author has postulated that besides the known sensory and motor nerves to the skin there exists another system, for which he has proposed the name "nocifensor nerves." The evidence for the existence of such special nerves is strong; it still lacks anatomical demonstration.

From the point of view of medical practice, the most significant part of the book is probably that dealing with deep pain and the associated phenomena of muscular tenderness and rigidity. Lewis and his pupil Kellgren have shown that not only is pain from a deep somatic structure indistinguishable in quality from the pain of visceral disease, but it is likewise referred to a distance in a segmental fashion, and is also accompanied by muscular tenderness and rigidity. This demonstration provides the basis for a review of the pain and associated phenomena of visceral disease. The controversy as to whether the source of pain and the associated reflexes in visceral disease is the viscus itself or adjacent structures is summed up as follows:

> "It is not fundamental unsoundness that renders either the first or second view unacceptable since each contains a large element of truth; it is their presentation as general laws, each exclusive of the other, which is objectionable. I believe that referred pain and associated phenomena are started sometimes in a visceral structure (not necessarily in the actual viscus) and sometimes from the anterior or posterior wall of the body cavity. The evidence that they can so start has been given and is, I think, in both cases conclusive."

From this account of its contents the reader will appreciate that this is an important book, for pain and the associated phenomena of tenderness and muscular rigidity are the very foundation of the diagnostic art. It can be confidently recommended to medical men not only as a book which will arouse their interest but as one which ultimately cannot fail to help their understanding of disease. It is, moreover, a unique illustration of what can be achieved by a forceful mind with the simplest of apparatus and methods.

PRACTICE OF AN AMERICAN SURGICAL CLINIC

Surgical Practice of the Lahey Clinic, Boston, Massachusetts. (Pp. 897; illustrated. $10.00 or 50s.) Philadelphia and London: W. B. Saunders Company. 1942.

The Lahey Clinic, Boston, Massachusetts, is one of the best known of the large American clinics and its reputation stands high in that country. The present volume is a series of articles on the surgical practices of the clinic, which constitute, as Lahey himself says in the preface, a true cross-section of the work embracing methods, techniques, diagnostic measures, and results. The whole field of surgical enterprise is not covered, but the articles nevertheless represent a very comprehensive survey of many of the commoner branches of ordinary workaday surgical practice.

The first 140 pages are devoted to certain aspects of thyroid surgery, the most interesting features in this section being articles upon the management of intrathoracic goitres and the routine dissection and exposure of the recurrent nerves in subtotal thyroidectomy, the latter reminding one of the old adage, "If there's anything you're afraid of in a surgical operation, go for it." After shorter sections on the oesophagus, lungs, and breast, the surgery of the alimentary canal and its accessories receives a considerable amount of attention. Of many points of interest here the following may be picked out as of particular value. In the performance of the operation of total gastrectomy many surgeons from time to time must have found it advisable to remove the spleen at the same time, but here we find it advocated as a definite advance in technique, of frequent application, making the operation easier and reducing the risk. In dealing with massive haemorrhage from peptic ulcers a conservative attitude is advised except for a very small group of cases in which the bleeding seems to be beyond control; these are dealt with usually by resection, but sometimes by less drastic means of surgical haemostasis. Informative chapters discuss the treatment of Crohn's disease and of abdominal fistulae. In the technique of gall-bladder surgery the practice of the clinic is orthodox, although cholecyst-jejunostomy is suggested in place of the common cholecyst-duodenostomy or cholecyst-gastrostomy when an obstructed common duct has to be circumvented. The Lahey two-stage operation for abdomino-perineal resection of the rectum, as would be expected, is fully described. The operative mortality has been 12% and the end-results have been particularly good, over 50% of the patients being alive after a period of 6 to 10 years.

Sections on certain gynaecological conditions, orthopaedics, and neurosurgery precede the final one on anaesthesia. A good deal of space is devoted to the application of spinal anaesthesia, and an interesting account is given of the technique of continuous, or fractional, spinal anaesthesia. This is advocated especially for operations of unpredictable length—the longest case recorded being of four and a half hours' duration. We imagine that this method (devised by W. Lemmon of Philadelphia) is unlikely to replace the very satisfactory and simple methods (such as those of Etherington Wilson and Lake) now in common use, since there are obvious difficulties and risks associated with it. Few abdominal operations can possibly last longer than the two-hours anaesthesia which nupercaine in suitable strengths can give, but the new method is an interesting exploration into the possibilities of this form of anaesthesia.

The illustrations throughout are to the point and of first-rate quality. Altogether this volume can be warmly recommended, for a strong element of common sense runs through the opinions expressed, and there are few who would not gain some useful information and guidance from it.

A TEXTBOOK OF MEDICINE

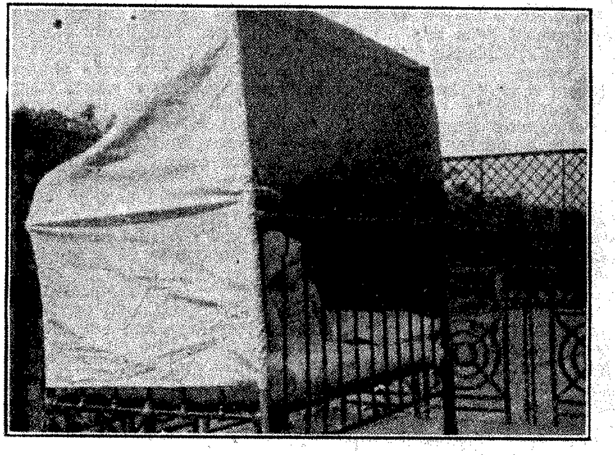
Medicine: Essentials for Practitioners and Students. By G. E. Beaumont, D.M., F.R.C.P., D.P.H. Fourth edition. (Pp. 801. 28s.) London: J. and A. Churchill. 1942.

When a textbook reaches its 4th edition in ten years its success is established and the reviewer's task is proportionately lightened. In those ten years Dr. Beaumont's experience has deepened, but also, to his dismay, the facts the student is expected to know have increased alarmingly. The mere catalogue of new features in this edition, whether new or rewritten articles or additional notes, occupies more than a page of the preface. Naturally, some in the first category relate to the effects of air raids, such as blast injury of the lungs and the crush syndrome. There is an interesting discussion under the latter heading of the parts played by intoxication of the kidney by myohaemoglobin and of the heart by potassium salts on the one hand, and, on the other, by the exaemia which results from the oedema of the compressed limb. There is also a helpful discussion of the factors in the severe jaundice of the newborn. We wish there were more such, for this work illustrates one of the present difficulties concerning students' textbooks. It seems to us that what is needed is a textbook of *principles* which will stimulate the student to do his own thinking and form his own conclusions. Given the encyclopaedic method, we do not see how the book before us could have been better done, but is it the right method? For example, the factors in uraemia, both actual and speculative, are duly stated, but there is no guidance as to their relative significance and importance. Naturally we realize that Dr. Beaumont, like the student, is the victim of an examination system which urgently calls for reconsideration.

Preparations and Appliances

BED AND COT TENTS

Dr. C. Paget Lapage (Manchester) writes: The illustration shows the essential features of tents which can be readily fixed to ordinary ward cots and beds. Primarily they were made for use on the ward balcony, especially in very windy or very sunny weather or for initiation of balcony treatment in weakly infants and convalescent children. They can, however, be used inside the ward, either to avoid draughts or for isolation purposes, though they are not necessarily ideal for the latter purpose. These tents also make it possible to give even delicate babies a daily airing, and this, to my mind, is one of the most potent measures for preventing ward infections.



The tents were made for me by Mr. Robert Burns of Hanover Mills, Buxton Street, Manchester, 1.

DO DOCTORS DISAGREE ABOUT PASTEURIZATION?

Most readers of the *Journal*, we imagine, will wonder if it is necessary to ask this question. And indeed those who have, over a large number of years, followed the evidence that has been reviewed in these columns will be inclined to dismiss the question as idle and rhetorical. But unfortunately it is still necessary to ask it and to reiterate the reasons why the majority of doctors who have given a moment's thought to the matter agree that pasteurization of milk is in the interest of the public health, and to examine the views of what must be a very small minority of those who do not agree. Unfortunately pasteurization of milk is one of those subjects on which the lay and uninstructed person believes himself competent to hold views. Such people usually begin their arguments by saying: "Ah, well, doctors don't agree among themselves about this." A few medical men, too, tend to attach greater significance to their personal views than to the evidence on which such views should be based. We should have thought that the evidence presented by Prof. Selby Wilson in his recent book, *The Pasteurization of Milk*,[1] would have convinced those who are capable of assessing such evidence—and among these we would like to include all members of the medical profession. Those doctors who do not agree that pasteurization of milk is necessary for the health of the people no doubt are sincere in holding the belief they do. No doubt also there are many sincere people who still believe that the world is flat; but among the majority who accept the evidence of science such a belief is looked upon as foolish and without foundation. By pasteurization we mean, it should be clear, the freeing of milk from pathogenic micro-organisms that might infect the consumer.

The question of pasteurization was discussed by the Parliamentary and Scientific Committee of the House of Commons on October 20, and subsequently a number of M.P.s, including a medical man, Sir Henry Morris-Jones, tabled the following motion:

> "That this House, realizing the unique value of fresh milk in the national diet, asks that His Majesty's Government should not, without the fullest inquiry, embark upon a policy involving the consumption of half-boiled milk, frequently known as pasteurized milk, which is still the subject of conflicting expert opinion; and further urges His Majesty's Government to pursue with vigour a policy to eliminate cattle disease, exterminate vermin, improve water supplies, and establish higher standards of cleanliness and hygiene on the farm and in the transport and the handling of milk on its way to the consumer."[2]

Sir Henry Morris-Jones, then, apparently considers it necessary at this late time of the day to make yet another inquiry into the value of pasteurization, "which is still the subject of conflicting expert opinion." Is there really any opinion that can be called expert which is in conflict with the view that pasteurization of milk is necessary to control the incidence of milk-borne infections? At the meeting of the Parliamentary and Scientific Committee the case against pasteurization was put by Dr. A. H. Macdonald, formerly chief medical officer to Dr. Barnardo's Homes. We will give here an excerpt from the report of what Dr. Macdonald said, issued by the Committee itself:

> "Another point to bear in mind was that children brought up on tuberculin-free milk (T.T.) were liable, if for any reason they had to drink ordinary raw milk which more likely than not would contain living tubercle bacilli, to develop tuberculous glands or peritonitis. . . . In recent years tuberculosis was said to be on the increase. Dr. Macdonald was not surprised, since more pasteurized milk had been consumed. He was afraid it would continue to increase so long as this state of control lasted, and the drinking of pasteurized milk became more general."

After some further observations on the subject Dr. Macdonald concluded, according to the account we have, that "the taking of clean raw milk, and not pasteurized milk, was one of the best means to combat tuberculosis." No doubt Dr. Macdonald believes what he says, and this argument should be examined because it is one that is not infrequently used by lay people who are also quite genuine in their opposition to the pasteurization of milk. What Dr. Macdonald is saying in effect is that, in order to offer a person protection against tuberculosis, children should be allowed to drink milk containing tubercle bacilli. In other words, he advocates that an oral vaccine of viable and virulent bacteria should be given in unmeasured doses at unstated intervals. There is surely no need in these columns to bring arguments against using a vaccine in this way. There is, however, one result of this method of vaccination which is undeniable, and that is that owing to the consumption of this milk at least 3,000 to 4,000 persons in this country contract bovine tuberculosis every year, and 1,500 to 2,000 die of it every year. Do those who think alike with Dr. Macdonald seriously believe that this country, if fully acquainted with these facts, would allow the medical profession to advocate a method of immunization which carries with it such a high mortality rate? Further, if it were agreed that an oral vaccine of viable bovine tubercle bacilli provided the best way to combat tuberculosis, would it not be more logical and more in keeping with what is known about the principles of immunization to give such a vaccine in accordance with these principles, rather than to leave it to the discretion of the householder to conduct this uncontrolled experiment herself?

We have picked out this one point because it formed the staple of Dr. Macdonald's opposition, and so no doubt it will be heard of again in the House of Commons and from those who, for whatever reason, share the hostility to pasteurization expressed by another speaker before the committee, Mr. David Quibell, M.P. Prof. Wilson rightly reminded those present at the committee that milk was at times responsible for spreading scarlet fever, diphtheria, enteric fever, dysentery, food-poisoning, and *Brucella abortus* infection. Pathogenic micro-organisms might come not only from the cow but also from the upper respiratory tract and from the fingers of farm workers. He reminded them, too, that another possible source of infection was sewage-polluted water used for dairy purposes, this being the origin of the milk-borne outbreak of typhoid fever in Bournemouth in 1936.

It is difficult to understand why a country which insists upon bacteriological purity of the water supply wishes to oppose the introduction of an equally pure milk supply, but at least no one has yet suggested that the public health authorities should allow typhoid bacilli to appear in the household drinking-water as a method of immunizing the susceptible population against enteric fever.

UNDER THE ELECTRON MICROSCOPE

The microscopist, like the specialist, seeks to discover more and more about less and less. To assist him in his task he has a variety of microscopes—the compound, the dark-ground, the ultra-violet, the infra-red, the fluorescence, and, latest comer, the electron or "supermicroscope." The glass-lensed compound microscope is capable of almost any degree of magnification, but for the demonstration of minute objects as separate entities—that is, for resolution —it is limited by the wave-length of light. The development of "electron optics" by television physicists has made the construction of the electron microscope possible. An electron beam replaces the light-source of the compound microscope, and a series of electromagnets focus the beam much as glass lenses focus a beam of light. Electron waves travel in straight lines only in a vacuum. The whole microscope must therefore be evacuated to a high degree. Since the waves are entirely invisible, their images must be made visible by the use of either a fluorescent screen or a photographic plate. By using electron waves 1/100,000th of the wave-length of visible light, it may be possible to obtain a magnification of 25,000 to 100,000 with accompanying resolution. One red blood cell would thus be enlarged to seven metres. Specimens for examination are mounted on a very thin collodion film; they must be dry and extremely thin.

The electron microscope is not yet an instrument for every pathologist's bench. Its immediate future lies rather in the research laboratory. It holds great promise in almost every field of science, as it reveals many important structures and reactions which have hitherto been inaccessible to direct observation and measurement. In chemistry it has been possible to obtain micrographs of the location of certain chemical reactions incident to the metabolism of the bacterial cell. Morton and Anderson[1] have studied the reduction of tellurites by *C. diphtheriae*, and have shown that crystals of tellurium form in all parts of the micro-organism, in some cases puncturing its walls. Electron microscopy has also proved of service in metallurgy, crystallography, and colloid chemistry, and in studies of molecular architecture. Possibly a new technology of staining for electron microscopy may develop. Recently Mudd and Anderson[2] have tested a method of selective microchemical analysis, equivalent to differential staining, by photographing specimens after exposure to the salts of heavy metals. Bound up with this work there is another promising field of application of microchemical analysis: this is the recording of the action of germicidal agents on bacterial cells.

Excellent micrographs of bacteria have been obtained, particularly by Mudd, Anderson, and their colleagues.[3] They have shown that many types of bacteria, including streptococci, pneumococci, anthrax and subtilis bacilli, typhoid and coliform bacilli, possess rigid outer membranes which protect their inner protoplasm. Flagella of motile forms are extremely delicate structures, some of which appear as two parallel lines with alternate thinner and thicker markings. Flagella of monotrichates—for example, vibrios—are on the whole wider in diameter. *Treponema pallidum* appears to have a continuous envelope, a knob-like structure at one end, and flagella-like processes at various points along its course. The protoplasmic inner structure of many micro-organisms is not homogeneous. In diphtheria bacilli, for instance, definite polar bodies are seen, and in tubercle bacilli areas of greater and lesser density are observed. Spores of subtilis bacilli appear as dense oval bodies.

In histological research the electron microscope has revealed characteristic cross-striations in collagen fibres, and the effect of various physical and chemical conditions on the fibres is being investigated by Hall, Jakus, and Schmitt[4] in a search for further knowledge of the molecular structure of collagen. To entomologists the new instrument discloses hitherto unseen structures and it permits the accurate measurement of those already recognized. The tracheae, trachioles, air sacs, wing scales, and cuticle have been studied, and experiments by Richards and Anderson[5] on the mode of penetration of the cuticle by non-volatile oils serve as an example of future useful applications.

The electron microscope may well show its greatest value in the study of objects between 5 and 250 mμ, a range not covered by the light-microscope and the one in which nearly all viruses fall. Micrographs of individual virus particles may be secured and their sizes and shapes established with accuracy. Green, Anderson, and Smadel[6] have shown that elementary bodies of vaccinia are rectangular in shape, resembling a brick, and contain five areas of condensation arranged somewhat like the five spots on a dice. Particles of tobacco mosaic virus appear in purified preparations as discrete rod-like units with a tendency to side-to-side and end-to-end aggregation. Bacteriophages, studied by Luria and Anderson,[7] disclose an extremely constant and characteristic sperm-like appearance with a round head and a much thinner tail; in many micrographs the head is filled with a dense internal structure. Such particles are adsorbed to their specific micro-organisms by head or tail, and after contact it is possible to see extensive damage to the bacterial cell. The discovery of such constant and detailed differentiation in objects of supposedly macromolecular nature is of interest also to geneticists, for genes, as well as viruses, are thought to be macromolecular entities. Sperms of the ram and the bull, owing to their extreme flatness, are amenable to examination and have already come under observation.

Finally it should be mentioned that the interpretation of results is limited at present by the necessity for placing the specimen for study in a high vacuum; by the inability to assess the changes effected in protoplasm and in molecules by the electron bombardment; and by the extreme thinness of the objects which the electron beam can traverse. Entomologists have commented on shrinkage, evolution of gas, discoloration, and increased friability of their specimens. The electron microscope is, however, in its early days, and some, if not all, of these difficulties are likely to be overcome by teams of physicists, chemists, and biologists, such as those already working for the National Research Council and the Radio Corporation of America.

CHARTING THE PULSE

The commonest type of clinical chart is still that which provides a graphic record only of the temperature, and relegates pulse and respiration rates to a cramped space at the foot, where they appear in figures. The careful perusal of these figures is no substitute for the instantly comprehensible picture given by charting all three graphically; significant tendencies then become evident at a glance, and the warning of some change in the patient's condition stares one in the face instead of having to be deduced laboriously by building up a mental picture from numerical data. The pulse rate can in some circumstances mean more than the temperature, and is equally entitled to display in the same form; in morbus cordis, for example, it may be the only feature in the chart showing significant variation. A falling temperature, in itself a usually favourable sign, assumes a quite different complexion in the presence of a steadily rising pulse rate, and the opposite tendencies of their two graphs afford an unmistakable danger signal. The evil obscurity of the ordinary chart had a hand in a fatality recorded by Joan M. Boissard and R. M. Fry[1] which also raises some other points of interest in diagnosis. A boy aged 12 fell 40 feet, fracturing both forearms and sustaining ruptures of the liver and right kidney; these were dealt with by suture and nephrectomy respectively. Reduction of the fractures under anaesthesia was not undertaken until some days later, when the general condition had improved. Both operations were followed by febrile exacerbations, and there is consequently little contrast between the temperature chart in the early stages and its behaviour after the twelfth day, which was the time of onset of a haemolytic streptococcal peritonitis due to a ward infection. The pulse, on the other hand, which had previously fallen and remained steady for several days, showed a continued rise, which is striking as seen in graphic form in this report, but was recorded on the patient's chart only in figures. When the abdomen was first explored only a serous fluid was found, which was not sent for bacteriological examination, and it was only on the day before death that a bacteriological diagnosis was made. The exudate in this form of peritonitis is sero-fibrinous and not frankly purulent. In the early stages it may contain but few streptococci; it should preferably be collected as a fluid rather than by swabbing, if necessary by aspiration via a catheter passed down the drainage tube. The bacteriologist is well advised to cultivate a large inoculum in glucose broth as well as to make the usual plate culture.

PROPHYLAXIS OF RHEUMATIC FEVER

It is now six years since the first attempts were begun in the U.S.A. to prevent recrudescences of rheumatic fever by giving sulphanilamide continuously over long periods. For reasons which are far from clear this drug does harm rather than good during the rheumatic attack itself, but, if administration is begun when the attack is over, the further activity of haemolytic streptococci is suppressed and throat infections such as precede further exacerbations do not occur. Caroline B. Thomas,[2] who was one of the first to adopt this method, now reviews her own experiences with it at the Johns Hopkins Hospital and those reported in five other American studies. Her patients, regardless of their age, which varied from 6 to 37 years, though the majority were between 14 and 26, were given 1.0 and later 1.3 g. of sulphanilamide daily in two doses from October until June; lately some patients have taken the drug all the year round with no summer intermission. This is now thought a better plan, and it is therefore proposed that rheumatic subjects should have an uninterrupted course of treatment lasting five years or even longer in younger patients. That further attacks can so be prevented all authors are agreed: during the first four years of Thomas's study 10% of a control group had recrudescences, and of the treated group none. Since then controls have been abandoned, and two cases only have occurred in which an exacerbation developed during treatment. Repeated throat swabbing showed the presence of haemolytic streptococci in 12% of control cases and in only 4% of the treated. The effectiveness of this treatment is therefore not in doubt, but is it feasible and safe? Apparently these patients can usually be depended on to continue taking the drug indefinitely and experience no ill effects even while engaged in strenuous occupations. They need to be shepherded through the initial stages while still in hospital, and in this series only two showed intolerance which caused the treatment to be abandoned; other authors, who have used larger doses up to 3.0 g. daily, have naturally had more such cases. In no instance have any toxic effects been seen after the first few weeks of treatment, and some of these cases have been under treatment for 3, 4, or 5 years, and one for 6 years, the last 4 without intermission, owing to the occurrence of a rheumatic attack during August of the second year, when treatment had been stopped for the summer. Thomas analyses all the recorded cases of agranulocytosis due to sulphanilamide, and points out that this complication has never been observed after the fiftieth day of treatment given for any condition, and is commonest between the fourteenth and twenty-first; during prophylactic administration for rheumatic fever agranulocytosis appeared on the twenty-ninth day in the only known case which developed it. The idea that prolonged administration is dangerous must therefore be abandoned, at least as it concerns small doses. No mention is made of the possibility that streptococci exposed to these low concentrations of the drug may acquire tolerance to it, and, indeed, there is no apparent evidence that such a thing can occur in this disease, a fact which may perhaps raise some doubts about the alleged development of "drug-fast" variants of susceptible bacterial species during treatment with inadequate dosage. We must therefore conclude that this treatment is effective, feasible, and safe; not only does it prevent further cardiac damage, but it is simple and cheaper than the institutional treatment demanded by rheumatic recrudescences.

Another method of prevention which has been tried in the U.S.A. is the subject of a further report by its authors, Valentine P. Wasson and E. E. Brown[3]; this is a prolonged course of immunization with a streptococcus culture filtrate. Almost all fresh light on the aetiology of rheumatic fever gained in the past few years points to haemolytic streptococci as the major if not the sole factor concerned, and, this being so, immunization by some means should be feasible during quiescent periods. Whether the best method of achieving this has yet been found is another matter, but here at least is an alternative form of treatment which merits further investigation.

THE CONDUCTING SYSTEM OF THE HEART

In twelve and a half pages of the *British Heart Journal* for July, 1942, appear the concentrated results of extensive scientific labour of the first order. A delightful historical note by Sir Arthur Keith tells the story of the discovery of the mammalian auriculo-ventricular node by Tawara (1905), and of the mammalian sino-auricular node by himself and Flack (1906). Prof. Francis Davies carries us further. He criticizes the view of Keith and Mackenzie that the nodes and A.V. bundle of the mammal are remnants of more extensive tissues of similar structure in lower vertebrates, on the ground that the complete nodal rings found at the junction of chambers in primitive hearts are not composed of specialized tissue as in mammals, but of unspecialized cardiac muscle arranged in a spiral so that the necessary delay in transmission of the cardiac impulse is achieved. Having made this discovery in the spotted salamander, Davies's researches to date suggest a similar arrangement in fish, amphibia, and reptiles. The specialized conducting tissue of mammals therefore appears to be a neomorphic development, associated with the need for quicker conductivity in the faster-beating hearts of homoiothermal vertebrates. This conclusion is supported by the even greater development and extension of specialized conducting tissue in birds, discovered by the author and described in this article; and again by the observations of Prof. Shaner, who found that the A.V. node and bundle of the 9 mm. calf embryo appeared to grow like any other embryonic organ, and did not behave like the remnants of more extensive tissues connecting the atria and ventricles at an earlier stage of embryonic life. These discoveries, modestly recorded, are of high importance.

PRESENTATION TO MADAME MAISKY

The Anglo-Soviet Medical Council has just come to the end of its first year of life. This precocious child anticipated its birthday in an unusual way by giving a present to one of its foster-parents when it handed to Madame Maisky on November 23 the first volume of *Reviews of British War Medicine*, published in Russian. Three thousand copies of this book have been printed, and with them goes the hope of British doctors that this small contribution will be of help to our great ally. The articles have been contributed by experts in the various subjects covered, which range from the treatment of burns to the electro-encephalogram in post-traumatic states. The authors remain anonymous, which we think is a pity. A second volume is on its way.

It was particularly fitting that the presentation should have been made to Madame Maisky, as she has shown a special interest in medicine and a live sympathy with its problems. When the time comes for Russian medical men to be eased of their terrible burden we may hope to welcome here a volume setting forth their knowledge and experience.

EXTRARENAL AZOTAEMIA

Extrarenal azotaemia is a condition in which the nitrogenous constituents of the blood are increased by causes other than primary failure of the kidneys. Urea, which forms the bulk of the non-protein nitrogen, is commonly used as an index of the degree of azotaemia. It is well known that a raised blood urea occurs in a variety of conditions such as loss or deprivation of fluid, gastro-intestinal haemorrhage, alkalosis, diabetic coma, and the crush syndrome. The exact cause of the azotaemia in these conditions is sometimes obscure, and recent studies have been made on two of the conditions with a view to clarifying the subject.

It has been known for many years that in gastro-enteritis of infants a high blood urea is found in untreated cases. With a view to determining whether this is due to a functional disturbance of the kidneys Young and McCance[1] have made a series of observations on normal babies and on infants of the same age suffering from gastro-enteritis. They find that the normal renal function of infants differs in some measure from that of adults, and is intermediate between the adult type and the type which they have previously shown to occur in newborn babies. Infants have lower glomerular filtration rates and urea clearances than adults (in relation to their surface area), and both these vary with the minute volume of the urine even at normal rates of urine flow, which is not the case with adults. In other words, when the volume of urine is decreased, as in gastro-enteritis, the infantile kidney is unable to adjust its function to the altered circumstances and produce a urine sufficiently concentrated to maintain the normal excretion of urea and other substances; there is no evidence of a specific renal lesion.

Azotaemia in gastro-duodenal haemorrhage has been studied by Black,[2] who concludes that several factors help to produce the high blood urea so often found in such cases. Large quantities of nitrogen are absorbed from the blood present in the bowel; but this probably cannot wholly account for the azotaemia. Increased formation of urea may also result from increased protein breakdown in the body; this, in turn, may be caused by dehydration and tissue anoxia. Further, there is decreased elimination of urea owing to a fall in the rate of glomerular filtration in the kidney, and formation of urine is slow. In a few cases a previous state of alkalosis or dehydration may be an aggravating factor. Black holds that the degree of azotaemia in gastro-duodenal haemorrhage is of value as a guide to treatment and in estimating prognosis. Continued azotaemia is an indication for restoring blood volume by transfusion and by the administration of fluid.

DRUGS FOR MYASTHENIA GRAVIS

The use of ephedrine in myasthenia gravis was obscured by the discovery of the value of prostigmine by Walker in 1935, but since that time there have been several reports that prostigmine and ephedrine together are preferable to either alone. The physiological basis for this clinical observation was a little obscure until research in a very different field provided a possible explanation. Bülbring and Burn observed in the course of experiments on the spinal cords of dogs that, while physostigmine (eserine) potentiated the flexor reflex, prostigmine (the synthetic analogue) scarcely influenced it unless adrenaline were present. This suggested that adrenaline might perhaps influence the action of prostigmine at the neuromuscular junction in the same way. In further experiments[1] designed to test this hypothesis Bülbring and Burn used cats anaesthetized with chloralose, and prepared so that the effect of drugs on the contraction of the gastrocnemius after stimulation of the sciatic nerve might be examined. They found that at low rates of stimulation the twitch tension was augmented by adrenaline if prostigmine was injected a few minutes previously. The same phenomenon was seen after physostigmine, though the effect was smaller. At higher rates of stimulation the increased twitch tension caused by the injection of prostigmine is diminished by adrenaline; and, similarly, in muscles tetanized to fatigue the normal augmentation after injection of adrenaline is diminished by prostigmine. There are two conditions now known in which adrenaline augments the contraction of skeletal muscle—first, in fatigue (as in the Orbeli phenomenon), and, secondly, after injection of prostigmine. Bülbring and Burn suggest that adrenaline increases the height of muscle contraction by potentiating the effect of the increased amount of acetylcholine which will in both conditions be liberated at the neuromuscular junction—in the first instance owing to the more frequent stimuli, and in the second because prostigmine prevents the rapid destruction of acetylcholine. Similarly, when too much acetylcholine is formed the effect of adrenaline is again to intensify its action and bring about depression. While this hypothesis may explain all the phenomena, it was also suggested that there may be some special relation between adrenaline and prostigmine; for instance, prostigmine augments the action of adrenaline upon the blood vessels.

To return to the subject of myasthenia gravis, there is no evidence that ephedrine itself bears any such special relation to prostigmine, but it seems very probable that ephedrine will benefit patients suffering from this disease by prolonging the effect of adrenaline naturally formed in the body, either from the adrenals or at sympathetic nerve endings. This constitutes the physiological justification for the use of prostigmine and ephedrine together.

War Medicine Series

The paper printed below is based on a lecture which was one of a series recently given at the British Postgraduate Medical School, Hammersmith

SULPHONAMIDE DRUGS IN WAR

BY
L. E. H. WHITBY, C.V.O., *M.C.*, M.D., F.R.C.P.
Brigadier, R.A.M.C.(T.A.R.O.)

It may be emphasized at the outset that there is no essential difference between peace and war so far as the principles which govern the employment of the sulphonamide group of drugs are concerned. Nevertheless, certain infections become more prominent during wartime, and it is with these, particularly meningococcal and wound infections, that this paper deals.

Principles of their Use

The first principle is that the infecting organism must be sensitive to the drug employed, the three drugs more or less readily available being sulphanilamide, sulphapyridine, and sulphathiazole. The meningococcus is sensitive to all three drugs, but the flora of a wound may be so diverse that judicious selection may be required to get the optimum result. The following table gives a rough estimate of the sensitivity of common wound bacteria to sulphanilamide, sulphapyridine, and sulphathiazole, it being borne in mind that there may be considerable variation in the susceptibility of different strains. Thus there are strains of *Staph. aureus* which are sensitive to sulphathiazole but not to sulphapyridine, and vice versa; while most strains are to some degree sensitive to both.

	Sulphanilamide	Sulphapyridine	Sulphathiazole
β-haemolytic streptococcus	+++	+++	+++
Staph. aureus	0	++	++
Proteus vulgaris	++	++	++
Bact. coli	++	++	++
Ps. pyocyanea	++	++	++
Str. viridans	0	±	+
Cl. welchii	++	++	++
Vibrion septique	0	++	++
Cl. oedematiens	0	0	0

A survey of this table shows that sulphanilamide, which is cheap, readily available, and also relatively soluble, has a fair range of activity against wound bacteria, including *Cl. welchii*, the commonest gas-gangrene organism, and is therefore the drug of choice for prophylaxis in the average case, whether oral administration or local application is used, or both. On the other hand, with an established infection either sulphapyridine or sulphathiazole is indicated because of the greater range, while polyvalent gas-gangrene antitoxin should also be administered as none of these drugs has any action on *Cl. oedematiens*.

The second principle is to obtain and maintain an effective blood-stream, spinal-fluid, or local concentration, but with serious generalized infections it is essential that the administration should be four-hourly night and day: too often the night doses are omitted, with the result that the concentration during the night hours sinks below the effective level. It is an axiom that the drug must be in solution to be effective; this is of considerable importance when making local application to wounds, and rules out the insoluble sulphapyridine. For wound application a mixture of sulphanilamide and sulphathiazole gives the greatest chance of success; and in theatres of war, where most gas gangrene has been found to be due to *Vibrion septique* or *Cl. oedmatiens* rather than *Cl. welchii*, sulphathiazole is certainly required. These drugs act best on small numbers of bacteria: this is perhaps the strongest argument for their free prophylactic use in wounds which from their site, extent, or nature are an open invitation to gas-gangrene infection.

A third principle involves the nature of the medium in which the drugs are called upon to act; certain substances completely inhibit action and must be excluded. Pus is one such substance, and it is therefore quite useless to expect the drugs to disperse a collection of laudable pus or to be at all effective when applied to a dirty and purulent wound; this, too, is a possible explanation of failure in deep-seated bony infections in which loculations of pus prohibit action. Nor can any great effect be expected from local application to a dirty, irregular, lacerated, pocket-laden wound, into many parts of which the dissolved drug cannot penetrate and in which foreign bodies, dirt, clothing, or bone provide an impenetrable shelter for implanted bacteria. These features show that the drugs are the handmaidens of surgery and not its master, and that the best results in wound-infection prophylaxis will be obtained by early combination of the two procedures.

A fourth general principle is to avoid prolonging treatment indefinitely when no clinical evidence of effect is forthcoming. What these drugs do they usually do quickly. Provided that adequate doses have been consistently administered at four-hourly intervals for a period of 7, or at most 10, days without beneficial action, no good can be expected from prolonging the course with that particular drug. The inference is that the infecting organism is insensitive. If further chemotherapy is contemplated the preparation should be changed: an early bacteriological examination is a useful check upon useless chemotherapy. As almost a converse to this principle it may be said that too early omission of the drug, especially in dangerous generalized infections, is apt to permit a relapse or an exacerbation; almost full doses should be continued for some 48 hours after the desired clinical effect has been produced.

Sources of Infection

The β-haemolytic streptococcus is introduced into a wound by human carriers and is not implanted at the time of wounding. Prophylaxis is here more a problem of hygiene than of chemotherapy. *Staph. aureus* is present in clothing and on the skin. Most other organisms are introduced by the soil. A gas-gangrene infection is implanted as spores, and the establishment of the condition is assisted by laceration of muscle, by blood clot, by the adjuvant action of aerobic bacteria, and by the presence of calcium salts. The latent period for the activation of anaerobic spores is from 5 to 12 hours, during which time, if proper surgical treatment can be given, the chance of preventing infection is good. Sometimes the infection is fulminating and is well established within a few hours. It is obvious that gas-gangrene infections will be most frequent in mobile warfare when there is unavoidable delay in obtaining surgical treatment.

Wound-infection Prophylaxis

The object of prophylactic chemotherapy is, first, to prolong the latent period before infection has become established until such time as proper surgical treatment can be obtained, and, secondly, to ensure that any residual infection after débridement shall be eliminated. If the two procedures can be combined so much the better. Oral administration is feasible in the most advanced positions in a battle zone; local application is neither so easy nor so likely to be efficient, because the wound has been neither cleaned nor trimmed. Nevertheless, the general opinion is that local application at the earliest possible moment is desirable even though efficient surgery has to be delayed: at least partial inhibition may be accomplished, and if supplies are adequate the procedure is justifiable. A second application at the time of débridement should always be made. Animal experiments have shown that local application alone does not prevent invasion of the blood stream by the β-haemolytic streptococcus; oral administration is also required in order to obtain a sufficiently high blood-stream concentration. On the other hand, local application, properly applied, is more effective in preventing the establishment of anaerobic infection than is oral administration; the anaerobes, too, are far less invasive than the β-haemolytic streptococcus, and the relatively low blood-stream concentration which local application engenders is high enough to prevent this complication. The general conclusion from animal experiment is that local application combined with small doses by mouth is necessary for efficient wound-infection prophylaxis. No extensive systematic assessment has yet been made, but the clinical impression of those who have seen active service is that these measures are effective and certainly superior to the use of antiseptics such as eusol, acriflavine, and hydrogen peroxide.

Dosage in Wound-infection Prophylaxis

For local application sulphanilamide is the drug of choice unless sulphathiazole is available, in which case a mixture of two parts of the former and one of the latter should be employed. From 5 to 15 g., according to the size of the wound, should be applied as a fine powder. However numerous the wounds not more than 15 g. should be used. The application should be made as early as possible and be repeated at the time of débridement. It is necessary to keep the wound moist with a saline gauze dressing or to cover the powdered wound with a vaseline spread. This last is recommended by Mitchell, Logie, and Handley (1941), who have had extensive experience in the Middle East. These same authorities recommend 5% sulphanilamide in 80% glycerin for deep cavities and joints. The powder may be applied with an insufflator, a pepper-pot, or even a tablespoon; it should be distributed evenly and completely, if this is possible, or applied to a moist saline gauze and thrust deep into the wound when circumstances demand. A War Office Memorandum (1940) recommends for oral administration an initial dose of 1.5 g. sulphanilamide followed by 0.5 g. four-hourly for 3 or 4 days as uncrushed tablets. The sooner this is administered the better, but it is important that all doses, and the time, should be recorded on the label attached to the patient, in the same way as morphine and antitetanic serum are recorded. Mitchell, Logie, and Handley (1941) consider these doses far too small for severe cases, and recommend as much as 4 g. for an initial dose, with subsequent four-hourly doses of 1.5 g. for 4 to 6 days, night and day; they state that they have seen many die from too little sulphanilamide but none from too much. To those who have the bogy of agranulocytosis always before them these heroic doses may appear to invite disaster; there is no doubt they are the upper limit, whereas the War Office Memorandum doses are definitely cautious. There is considerable scope for clinical judgment between the two limits according to the nature of the wounds, the higher doses being used when indications suggest that gas gangrene is inevitable. Similarly, clinical judgment will sometimes suggest that an early administration of gas-gangrene antitoxin is justifiable.

Treatment of Established Wound Infection

With acute infections both oral and local treatment should be undertaken. On account of their greater range either sulphapyridine or sulphathiazole should be used for the oral doses. Oral dosage may be as much as 10 to 12 g. daily for 7 to 10 days with a severe and extensive gas-gangrene infection; antitoxin in doses of 20 to 40 c.cm. daily for 4 or 5 days is also advisable. Frankly purulent wounds need to be cleaned up before local application is made. Chronic wound infection does not demand oral therapy unless a generalized infection appears likely; all purulent material must be removed from the wound before local application is made. Excellent results have been obtained, with rapid healing, in wounds resulting from burns. Skin-grafting may be practised on a wound-bed previously sprinkled with sulphanilamide.

Meningococcal Infections

With early administration and adequate dosage bacteriostasis is complete within 12 to 24 hours. In epidemics early recognition of cases is of first importance. With unconscious patients a soluble preparation is required at the outset, but this should give place to an oral one as soon as swallowing is re-established. The soluble preparation should never be administered intrathecally, and most authorities do not advocate the giving of serum. Sulphapyridine and sulphathiazole are somewhat more effective than sulphanilamide, and sulphathiazole is preferred on account of its less nauseating reaction. A normal fluid intake should be arranged. For adults the "loading dose" is 2 to 3 g. and the maintenance dose 1½ g. four-hourly night and day for 2 to 3 days; thereafter 1 g. four-hourly for 2 days, followed by 0.5 g. four-hourly for 2 to 3 days; total dosage 40 to 50 g., according to clinical judgment. Failure to respond to this schedule of dosage usually means that the concentration in the cerebrospinal fluid has not reached the required amount of 3 to 5 mg. per 100 c.cm. When samples of spinal fluid are sent for estimation of drug content care should be taken that no traces of novocain are present in the sample, as this anaesthetic gives a colour reaction similar to that of the sulphanilamide group. Meningococcal septicaemia responds to somewhat smaller doses; the amount recommended is a loading dose of 2 g. followed by 1 g. four-hourly until 48 hours after the temperature has become normal. The meningococcal carrier has always been a problem. Modern opinion is that a bacteriological search for carriers is not worth while in view of the ease with which the infection itself can now be controlled. There is as yet no proper estimate of the value of sulphathiazole snuff in the treatment of obvious carriers; it is claimed, however, that 1 g. of sulphanilamide by mouth six-hourly for 6 days entirely clears the carrier state.

Bacillary Dysentery

Intestinal infections are a major problem in Eastern theatres of war. For the treatment of bacillary dysentery sulphaguanidine, when available, has proved of great value. This drug has the curious property of being soluble in the intestinal contents but of being poorly absorbed unless there is a grossly ulcerated surface. The dosage employed is large, amounting to as much as 20 g. a day for 5 or 6 days.

INJURY TO LIMBS

A ROEHAMPTON CONFERENCE

At the invitation of the Director-General of Medical Services of the Ministry of Pensions, a conference of surgeons was held at Queen Mary's Hospital, Roehampton, last September, Mr. G. R. Girdlestone presiding.

Ward Demonstration

Mr. T. P. Kilner and Mr. George Perkins opened with a demonstration of plastic and orthopaedic cases in the wards. Mr. Kilner urged that "the best dressing for a large open wound is skin," and suggested that all surgeons in charge of accident services should be given the special equipment which facilitates the cutting of large Thiersch grafts of selected thickness. He gave a most useful demonstration of cases illustrating the use of thick Thiersch, tubular, and flap grafts. Mr. Perkins first showed a patient with the moderate but disabling degree of equinovarus associated with the relative weakness of the external popliteal group of muscles after a partial sciatic recovery. These patients are much benefited by an inside iron, outside T-strap, and a toe-raising spring attached to the outer side of the sole opposite, but not distal to, the fifth metatarsal head. He then illustrated by a number of patients his belief that it is the use, as natural as possible, of the muscles surrounding the fracture which stimulates and accelerates union. He limits the extent of his plaster splints to the margin of safety, and dislikes the Böhler iron and the single stick. He likes a heel-and-toe movement, with particular attention to the active use of the toes. Crutches or two sticks with less splintage are preferred to a long plaster which makes full weight-bearing safe. He goes so far as to recommend that splintage can often be discarded, at least during the waking hours, on palpable evidence and before radiographic evidence of union.

Deranged Knee-joint

Prof. R. J. Willan opened a discussion on "failures following operation for derangement of the knee-joint." He stressed the value of an exact history, and the far greater value of the evidence which can be elicited by x-ray examination as well as by clinical examination. Once again it was made clear that the diagnosis of an internal derangement, indicating the removal of a semilunar cartilage, requires great care and much consideration. Furthermore, if this is true in civil life, a decision to operate on a soldier or a pensioner requires even greater and more deliberate judgment. Mistakes in technique were also discussed: accuracy, adequate exposure, and haemostasis by interrupted suture being among the points considered. Finally, Prof. Willan stressed the need for a very thorough "reconditioning." The main concern of Mr. Julian Ord, speaking on the treatment of "minor fractures," was the tendency to keep these fractures in plaster for too long. It was apparent that in his own clinic periods of splintage were safe which others might think dangerously short. Once again the principle emerged that it is the man and his team rather than the method which makes for success. Close observation and a well-drilled staff in a fracture clinic can bring success by methods which in other hands would be dangerous.

Scaphoid Fracture

Prof. T. P. McMurray—on "non-union of fractures, with special reference to the scaphoid of the wrist"—said that, in his opinion, the non-union of the scaphoid could result from missing the diagnosis, or, though not so often, from a failure to reduce a displacement. It was wrong to suppose that the fractured scaphoid was almost always just a crack without displacement. Furthermore, those in which there was displacement, and in which no reduction was accomplished, would be (*a*) less likely to unite, and (*b*) more likely to give rise to a secondary arthritis. There was a practical test of deformity which could be applied very gently and slowly when the case was first seen after the accident. If there were no deformity, and in the absence of post-traumatic swelling, a full range of movement could be accomplished, whereas the presence of deformity would limit the movement. He advocated carrying the plaster to the tip of the thumb, and said that the position of the wrist should not be in dorsiflexion but neutral. As to bone-grafting, this should be limited to delayed union in the presence of perfect reduction, but it was a great mistake to graft a scaphoid where there was malposition of the fragments, whether or no secondary osteo-arthritis had already occurred. Then there was the question of late ununited wrist fractures in which the bone appeared as if it were congenitally bipartite. This condition would not, *per se*, be responsible for pain or for disability. It was possible that the joint might be a little more sensitive to a sprain, but the essential thing was that after *x*-ray examination had disclosed the old fracture the injury should be treated as a sprain and nothing more. On the other hand arthritis might have developed and a sprain or continued occupational strain aggravate and so call attention to the arthritis. In the presence, then, of arthritis with non-union bone-grafting was absolutely contraindicated. If the disability was severe enough the scaphoid should, in his opinion, be removed. He admitted that reported results had not been good, but thought this was possibly due to traumatic methods of scooping out the scaphoid. He preferred a gentle, if tedious, dissection with scalpel and forceps. He admitted that the power of the hand was less than normal, but the hand could be more freely used than in the presence of radio-scaphoid arthritis. After this operation the joint should be kept at rest for six weeks, when active movement should be gradually resumed.

In the discussion there was general agreement with Prof. McMurray's main thesis, but with regard to the secondary radio-scaphoid osteo-arthritis there were advocates of arthrodesis as well as the excision of the proximal row of carpal bones.

The Crippled Hand

Mr. Gordon Irwin's talk on "late surgery for disability of the hand following gunshot wounds or septic infection" was accompanied by a cinematograph demonstration. For old "flares" he favoured delayed incision and active movements throughout. Provocative massage was advisable before doing a plastic operation, on account of the danger of "flares." For Dupuytren's contracture, excision and grafting was better than tenotomy. For stiff fingers, the position of the bones when fractured was immaterial. The motor apparatus was, however, most important. He had never succeeded in restoring movement in stiff fingers by any form of surgery. It was justifiable to amputate a finger if it interfered with the patient's working capacity, but amputation of the hand was done too often. He had performed several successful cineplastic amputations, but the limb-fitters had never been able to fit a suitable prosthesis. Repair of extensor tendons was usually successful; repair of flexor tendons gave poor results. In amputation of the finger the head of the metacarpal should be left, because function was more important than a cosmetic result. He had not seen painful stumps after finger amputation except when there was a question of compensation or pension. Excision of nerve bulbs never succeeded in abolishing the tenderness. Correction of malunited phalanges by osteotomy gave bad results. Fingers should not be splinted for longer than 7 to 10 days. In splinting, the thumb should not be held in the plane of the hand, but be abducted and at a right angle to the plane of the hand. He was not in favour of doing plastic reconstruction of fingers.

Mr. Kilner emphasized that for crippled hands prevention was better than cure. After seeing burns treated in many hospitals he was a strong supporter of the Bunyan method, and, in particular, he advocated the first-aid Bunyan bag filled with a sulphonamide. The important things in the treatment of burns were the early control of infection and the early removal of necrotic tissue, so that the raw area could be covered with a skin graft at the earliest moment. The best dressing for a raw surface area was transplanted skin. Early movement of the fingers was most important—another argument in favour of the Bunyan bag. The nursing difficulties were greatly lessened when this bag was used, because the patient could be moved painlessly. In treating burnt hands the forearm should be slung. Resting the hand on a pillow encouraged deformity. In Dupuytren's contracture, and in burns, the important question was, Has skin been lost? If so, it should be replaced by a graft. He inquired whether any operation on fixed finger-joints was worth while, and he thought that the value of cineplastic amputations should be reinvestigated. Mr. Stevenson thought that scarcity of material would prevent the wide application of the Bunyan-bag treatment; a short arm bag would be economical; a further economy was the manufacture of electrolytic sodium hypochlorite in hospital. He was not satisfied that the ideal first-aid treatment for a burn had yet been found, and thought we might go back to an oily solution. He had had good results by grafting skin on the end of a denuded terminal phalanx, but not much success in repairing flexor tendons in the hand. He was strongly opposed to the treatment of hand and finger injuries in a septic casualty department. All patients with these injuries should be admitted; they ranked in urgency with fractured femurs. Rear-Admiral Gordon-Taylor said that many burns had been treated by tanning, but it was not generally realized how many patients had at times to be looked after by one doctor, who, perforce, chose the quickest and simplest treatment. He deprecated the modern view that cut tendons should not be immediately sutured.

Mr. Irwin, in reply, said he had himself had the two flexor tendons of the index finger sutured two weeks after they had been cut. The result was excellent. He always used to advocate immediate suture of cut tendons, but after reviewing his cases he decided to suture later, and his results since had greatly improved. He advocated the Bunyan bag as a first-aid treatment. Lengthening fingers with bone grafts covered with grafted skin was rarely worth attempting because a finger was very little use unless it possessed delicate sensitivity. In repairing tendons he had successfully grafted extensor tendons, but had failed with flexor tendons.

Dr. E. S. Marshall opened a general discussion on "rehabilitation in Ministry of Pensions hospitals."

The Nov.-Dec. number of *Industrial Welfare and Personnel Management* (the journal of the Industrial Welfare Society, 14, Hobart Place, S.W.1) includes a timely article by Dr. H. M. Vernon on the relation of long hours of work to reduced output, which emphasizes the need to distinguish between the short-sighted policy which aims at an increased output for a few weeks only and the long-sighted policy which aims at a steady output enduring for months and even years. He stresses the point often made in these columns that the hours usually adopted in this country are almost certainly too long for an extended and prolonged effort. There is also a paper on industrial dermatitis by Dr. A. D. K. Peters, being part of an article published in the current number of the *Practitioner*; and an abstract of a lecture by Prof. J. C. Drummond on the nutritive value of canteen meals.

WORK OF THE MEDICAL CORPS IN THE U.S.S.R.

By a Soviet Doctor

Until the end of the 19th century military medicine was influenced mainly by one idea—to treat the wounded soldier because the latter was a sick man and as such had the right to claim medical help. Armies at that time were not large and they suffered fewer casualties because destructive arms were not nearly so developed. New drafts to replace the losses were obtained relatively easily: the proportion of the mobilized among the people was not large. Modern wars, on the other hand, are distinguished by particularly intensive fire; destructive arms have been greatly developed in both quality and quantity; losses have become very high. This means that medicine is now faced with a new problem—the rehabilitation of the greatest possible number of casualties in the shortest time. Were the belligerent Powers to allow themselves the luxury of neglecting medicine, then no war potential could be large enough to replace human losses. Thus the medical service has become not only an organization for the administration of treatment to casualties but an integral part of the military apparatus for Army reinforcements.

Two Ways of Thinking

And even that is not all. The solution of the problem also depends on the approach made to the part which the soldier has to play in the Army, and this, in its turn, is conditioned by the political system. For the Germans, for instance, the soldier is nothing. Man as a human being does not exist for them. The philosophical conception of Nazism, as defined by themselves, consists in the supremacy of race and in the idea of State power dominating the world. There is no place in this conception for the protection of an individual. Hence, also, the "philosophy" of the German military medical service. A wounded man who requires prolonged care and treatment is so much ballast for them, a burden to be dropped and finished off.

The medical doctrine of the U.S.S.R. has as its focus the life of the Soviet man, the Soviet patriot. The strength of our Army is not measured by the number of pawns but by the number of highly intelligent Red Army men; and the conclusion to be drawn from this doctrine is a fight for the life of every Red Army man, every Soviet citizen.

Prophylaxis and Hygiene

The military medical authorities paid the greatest attention to prophylactic measures before the war. Soviet military medical officers are not only surgeons, physicians, narrow specialists, but, in the first place, hygienists—they watch over the hygiene of food, accommodation, clothes, and the personal health of Red Army men. Realizing the importance of sport in the training of troops, it has been placed under the strict control of medical officers; and the whole sports organization in the Army is supervised by the medical authorities. The widespread adoption of prophylactic measures helps to prevent food-poisoning, seasonal respiratory illnesses, and infectious disease.

Field Clinical Medicine

The second principle of our military medicine lies in the wide use made of clinical medicine in the Army. Soviet clinical medicine has long since ceased to regard casualties as surgical cases. The wounded man is, before anything else, sick, and needs as much general as surgical treatment. The wide philosophical interpretation of pathology and therapeutics as "anthropathology" and "anthrotherapeutics," as opposed to local pathology—the treatment of the patient and not of his disease or organ—allow one also to make a different approach to the problem of the wounded man. In addition, the intensity of contemporary battles and the immensely difficult conditions in which modern soldiers are placed cause considerable increase in somatic and neuropsychological illnesses. Clinicians observed this already during the 1914-18 war; a large number of cases of nephritis, hepatitis, and diseases of the respiratory tract caused at times more casualties than gunshot wounds. Soviet medicine therefore started on the road of large-scale clinical medicine in the Army, and introduced into military medicine the new chapter of "field clinical medicine." This means in effect that military medicine must solve the problem of rapid diagnosis and treatment in the operational field environment. Diagnostic laboratories, field x-ray installations, electrodiagnostic and therapeutical apparatus, are all in universal Army use, up to the front-line hospitals. We know that even in times of peace early diagnosis and rapid medical intervention cut short pathological processes or reduce the periods of hospitalization to a minimum. In times of war this is a decisive factor.

Surgery at the Front

As regards surgical treatment, Soviet military medicine is guided by the principle of maximum surgical aid during the first hours. This forced us to employ all means for the speedy removal and evacuation of casualties from the immediate fire zone. In this work medical orderlies, men and women (volunteers), display miracles of courage. The People's Commissar for Defence, Comrade Stalin, compares the work done by the medical personnel to that of the best tank-drivers and airmen. The numbers of men and women decorated for the evacuation of wounded from the battlefield are counted by the thousand. The second measure is the administration of the best surgical treatment to the wounded in the field. Surgical hospitals, equipped with most modern apparatus and staffed by the best surgeons, work under direct enemy fire. If one remembers that these hospitals and medical posts are all stocked with transfusion blood brought by the Air Force, and that they have at their disposal all modern chemical and pharmaceutical supplies, then it is understandable why the percentage of recovery and return of soldiers to their units reaches the high figure of 70.

Non-medical Personnel

In conclusion, a few words must be said about the medical personnel. In the Red Army, medical personnel (excepting doctors) are people who go to the front as volunteers to do this work. Hundreds of thousands of young people (mainly girls) were already trained in peacetime for this work in all factories, institutions, and collective farms. The Red Cross and Red Serpent organizations were able to prepare fully the necessary cadres of the middle and lower medical personnel. They all passed courses in bandaging, blood transfusion, and first aid, and they are all blood donors. Direct blood transfusion on the spot at field hospitals and dressing stations has become an everyday feature at the front. It is also an expression of the unbreakable link which exists between our Army and people.

In summing up it may be said that the Red Army medical doctrine is based on the importance of the human element—the high value of the Red Army man. Its corner-stones lie, therefore, in the prevention of disease and in field clinical medicine. Early surgical intervention and treatment account for the high percentage of cure among the wounded. This implies, in practice, the concentration of all the best medical personnel and equipment at the front. Great capacity for self-sacrifice on the part of the personnel ensures the best possible care for the wounded and sick.

Workers with the Friends' Ambulance Unit, that body of some 700 persons who, unable to reconcile warfare with their religious beliefs, devote their energy and resources to the relief of the suffering which follows in the wake of war, share much of the hazards and dangers with the combatants. In the Middle East the unit has more than 150 members, some 40 of whom, in Egypt and the Western Desert of Libya, have been working under the auspices of the British Red Cross, especially on mobile surgical units. Some of them manned a hospital in Tobruk until that place fell. The report of the third year's work describes the establishment of mobile clinics in Syria, to which come Moslem, and Christian, and Druse; the distribution of medical supplies along the Burma Road; the salvage of £120,000 worth of such supplies from the docks at Rangoon when the Japanese were closing in, and their transport for 3,000 miles into the northerly provinces of Free China; the provision of surgical aid in the raided towns of Burma; the sending of a surgical team for the help of Chinese on the Yunnan front; the organization of first-aid posts in view of the possibility of air raids on Indian cities; and in Ethiopia the sending of 40 men, including 2 doctors, for pioneer medical work in the outlying regions where there are at present few or no facilities for combating the high incidence of sickness. Apart from all this work over-seas, 186 members of the unit are at E.M.S. and other hospitals in this country, and 90 have been seconded to the Friends' War Relief Service in the various raided areas of England. The council of the unit, which includes 9 medical members, one of whom is Sir George Newman, is appealing for at least £30,000 in order that the unit may maintain through a fourth year of war its purpose of serving where the need is greatest.

Reports of Societies

THE PIONEER HEALTH CENTRE

At a meeting of the Maternity and Child Welfare Group of the Society of Medical Officers of Health on Oct. 24, with the president, Dr. **CATHERINE MORRIS JONES**, in the chair, Dr. **INNES PEARSE**, co-director of the Peckham Pioneer Health Centre, gave an address on the principles which had governed this very successful experiment since its foundation by Dr. Scott Williamson and herself.

The Peckham Centre was conducted as a club, the athletic and social activities offered for all ages serving as an incentive to families to join and also concealing a careful technique whereby physical and mental health was fostered by means of swimming-bath, gymnasium, playgrounds, music rooms, and workshops. The Centre was self-supporting, though each family paid only a shilling a week. The families belonged to the elastic middle class, including artisans and professional men: yet even in this picked class Dr. Pearse reported that 90% of the individuals showed deviations from health which could be detected by clinical examination alone. Health was regarded at the Peckham Centre as a positive condition and not merely the absence of sickness, and the medical directors aimed at the cultivation of mental and physical health in the family as a whole. With careful periodic medical overhauls of each individual and routine laboratory investigations, a feature was made of family conferences and discussions between the parents and the medical man and woman who supervised the health of the family. Dr. Pearse described how fathers and mothers could be brought by this means to realize the biological significance of family life. The health sense of the little community was excellent; diphtheria immunization presented no problem because one family followed the example of another in each health measure undertaken. The Centre achieved its success by the active good will of its members, and the two medical directors had cause to congratulate themselves on a noteworthy achievement. They brought about, at a stroke, the health examination of all members of the family and all ages; they involved the father in the active exercise of parenthood; and they devised a medium whereby leisure could be utilized as a means for the development of physical and mental health. The lessons from Peckham should not be ignored in planning the future of medicine.

MASS MINIATURE RADIOTHERAPY

At a meeting of the Association of Industrial Medical Officers Wing-Commander R. R. **TRAIL** and Dr. F. R. G. **HEAF** spoke on the future of mass radiography in industry.

Wing-Commander Trail said that mass miniature radiography must be conducted on a carefully planned method if economy of time and materials was to be ensured. Both adequate space and suitable staff were necessary to use static apparatus economically, and about 100,000 cases a unit a year could be dealt with. This would mean one-way traffic through waiting and dressing rooms, and the provision of a suitable dark room, drying room, viewing room, and administrative office. The staff needed were the medical officer, radiographer, the positioner, marshal, and clerk. The medical officer should be a competent chest physician and, in common with the rest of the team, have special training in mass miniature radiography. A good team could easily manage up to 100 patients an hour. Miniature radiographs were often difficult to read, and in all doubtful cases a full-sized film should be taken; this was necessary in about 3% of the cases seen. Symptomless heart abnormalities, new growths, cysts, etc., might also be discovered at the same time. As regards the extent to which this new method would crowd out the beds available for pulmonary tuberculosis, there might be some difficulty at first, but any extra expense involved would be more than saved within ten years.

Dr. Heaf said that the use of mass miniature radiography on a large scale was a pleasing dream for the idealist but a nightmare for the realist. There were many difficulties. There would be opposition from the public, who would have to be carefully educated to appreciate the value of early diagnosis. Financial help during treatment and a guarantee that employers would co-operate in finding alternative employment for those that required it would be necessary before the confidence of the public could be gained. Planned liaison between tuberculosis officer, industrial medical officer, and panel doctor would be imperative. The public tested would fall into three groups: (1) Normal cases; these patients must realize that a normal film did not necessarily imply future immunity. (2) Mild or very early cases for whom modification of work or curtailment of working hours would be necessary. (3) Cases which could only be treated in a sanatorium; the scheme for financial help to compensate these patients for loss of income, etc., was one which would be widely welcomed.

There must be some method, Dr. Heaf said, whereby a suspect could appeal against the findings of the radiographic examination. A subsequent examination and further investigation might prove the original diagnosis to be at fault. It had been suggested that before a doubtful case was notified inclusion on a temporary register of suspects might be desirable. This would, in many cases, avoid the stigma attached to formal notification. Cases on the suspect list could be seen at frequent intervals, and progress or otherwise could determine whether discharge or notification was necessary. The ancillary health services must move forward with miniature radiography, improved methods for the relief of bad environment being just as important as improvement in methods of treatment. The effects of miniature radiography on established procedures of life insurance and superannuation schemes might be debated with interest.

RUPTURE OF THE UTERUS

At the last meeting of the Section of Obstetrics of the Royal Academy of Medicine in Ireland the president, Dr. **NINIAN FALKINER**, gave an account of 12 cases of rupture of the uterus which had occurred in the Rotunda Hospital during the past two years. Of the 12 mothers, 3 died and 9 recovered; of the 12 infants, 3 recovered and 9 were lost. Two of the surviving children were in cases in which the rupture was incomplete, and the third in a case in which the rupture was produced during extraction of a breech. The first maternal fatality was undiagnosed and treated as post-partum haemorrhage, the second was undiagnosed and treated as ante-partum haemorrhage, and the third was a most unusual case which followed a fall in the street. Of the mothers who recovered 4 were treated by subtotal hysterectomy and 4 by suture of the uterus. One was treated conservatively. Of the mothers who died 2 were not treated and one was treated by subtotal hysterectomy after Caesarean section. The average age was 35, and the average parity 5; none of the patients was a primigravida. In 9 cases the patient was in labour; in 3, not. The rupture was spontaneous in 9 and traumatic in 3 cases (fall, injudicious use of forceps, and difficulty with extended arm). The rupture was complete in 8 cases and incomplete in 4; it occurred in 3 cases in which classical section had been performed. The diagnosis was made in 9 cases before treatment was instituted, and in 7 of these it was made by correlating the symptoms and physical signs and in 2 by directly palpating the rupture.

Dr. R. M. **CORBET** said he had seen 35 cases of rupture of the uterus, 16 of which had occurred during the time he was Master of the Coombe Hospital. The mortality of the total collected series was 28.6%. About 1930 he had come to the conclusion that, if rupture were diagnosed or strongly suspected before delivery of the foetus, laparotomy should be performed, the uterus being removed or retained according to the conditions found. Since then he had had 16 cases of rupture of the uterus under his care. The treatment was primary Caesarean hysterectomy in 11 cases, with one death from mesenteric thrombosis. Laparotomy and suture of the rent had been done in 2 cases, with no death, and one patient died just as he arrived on the scene before any treatment could be undertaken. From these 16 cases 8 live babies were obtained. He felt that the advice, given in so many textbooks, to deliver the patient vaginally after rupture had been diagnosed was exceedingly dangerous.

Prof. A. H. **DAVIDSON** observed that the fact that 3 of these ruptures had occurred in "classical" scars should, he thought, teach obstetricians not to do "classical" sections. All ordinary sections done either before or during labour should be done in the lower segment. He was convinced that all cases in which the rupture was in the body of the uterus should be treated by laparotomy, followed by whatever treatment the doctor in charge of the case thought best. He thought that there was still a place left for conservative treatment by plugging the rent. The "classical" scar in a case in which the section had been done for toxaemia was a very bad one.

Dr. O'DONEL BROWNE, Dr. J. G. GALLAGHER, Dr. JAMES APTHORP, Dr. T. M. HEALY, and Dr. EDWARD SOLOMONS also took part in the discussion. Dr. FALKINER, in reply, said that a desperate condition in failed forceps was when the uterus had been even partially ruptured. These cases were often in primigravida, and when the abdomen was opened hysterectomy was the only course to adopt. It was very difficult to decide whether plugging the rent was going to be effective or not Sometimes the control of haemorrhage could be effected only by total hysterectomy. The case of transverse presentation had been treated by external version. In these cases the first thing to be thought of was the patient's life; the second was the necessity for preserving the function of reproduction

At the annual general meeting of the Association of Anaesthetists of Great Britain and Ireland, held at 1, Wimpole Street, London, on Oct. 28, the following officers were elected for the ensuing year: President, Lieut.-Col Ashley Daly, R.A.M.C; vice-president, Dr. C F. Hadfield; hon. treasurer, Dr. Z Mennell; hon. secretary, Dr. A D. Marston.

Correspondence

Pathology of Crushing Injury

SIR,—The circumstances of war have recently been such that cases of crushing injury are now very rarely encountered in this country. The review by Dr. E. G. L. Bywaters (Nov. 28, p. 643) is, nevertheless, extremely valuable, and serves to remind us that the pathology of the condition is still obscure in spite of the continued efforts of large groups of research workers.

Shortly after Dr. Bywaters's first paper appeared in the spring of 1941 I was permitted to study the pathology of 3 cases in considerable detail (*J Path. Bact.*, 1941, **53**, 403). I was not impressed by necrosis or regeneration of the tubular epithelium as a sufficient cause for suppression of urine, and emphasized blockage of tubules by casts. Such epithelial necrosis and regeneration as occurred was attributed to these casts, and tubular basement membranes were well preserved. The kidney lesions were compared with those found in multiple myeloma. The impaction of small casts in the lumen of almost all the tubules in the crush syndrome must result in a rise in intrarenal pressure, and no one tubule can then dilate to pass glomerular filtrate as neighbouring tubules are all similarly involved. In contrast the slow and probably intermittent deposition of casts in myelomatosis does not involve every tubule at once, neighbouring tubules allow the affected tubule to dilate slightly, fluid continues to pass, and the casts grow by accretion until surviving tubules are dilated by large casts.

In the crush syndrome casts occupying only a short segment of tubule may appear relatively unimportant and be found only in a few tubules in any one section, yet almost every nephron may be blocked Other workers have found it necessary to emphasize extensive necrotic and regenerative changes in the epithelium of the renal tubules and to discuss their production by various products of damaged muscle. Such lesions may result from a variety of superimposed factors, including insufficiency of the blood circulation. The problem is to decide what is the basic and essential lesion. The observation of Dr. Bywaters that crushing of the muscles alone in the rabbit will produce all the signs and symptoms of crushing injury except the renal failure is of special interest, and we have made similar observations in the mouse where we now suspect the same explanation—i.e., a low myohaemoglobin content of the muscles. The production by Dr. Bywaters of renal symptoms by the injection of pure myohaemoglobin into a rabbit acidified with ammonium chloride is very relevant. His observations on whether this substance acts by its precipitation as casts in the acid urine or by damage to the renal epithelium will be of the greatest significance.

Animal experiments are, however, often difficult to interpret. For example, Eggleton *et al.* (*Journal*, 1942, **2**, 392) report somewhat inconstant collections of material within the lumina of the terminal part of the proximal convoluted tubules while the distal and collecting tubules are usually free and distended after the compression and traumatization of the limbs of anaesthetized dogs. This is certainly not the pathology found in human cases. Functionally, the kidney of the dog may differ from that of man, but until this is proven the morbid anatomist must insist on a closer correspondence of structural lesions before accepting the identity of these conditions.—I am, etc.,

Queen's University, Belfast J EDGAR MORISON.

Small-pox: Its Diagnosis and Xylol Treatment

SIR,—As small-pox has once again made its appearance in the British Isles in epidemic form, may I, with 33 years' clinical experience in India, be permitted to draw attention to the pamphlet by the late W. McConnel Wanklyn, *The Accurate Diagnosis of Small-pox*, price 6d., printed by Ash and Co., Ltd., Henry Street, Tooley Street, London, S.E.1: This pamphlet should be in the possession of every doctor. After reading and learning its 24 pages it is almost impossible to have any doubt as to the diagnosis of chicken-pox or small-pox or to make any mistake, at any stage, in either disease.

No textbook that I know of or have read gives any specific and definite line of internal treatment for small-pox; yet there is one—xylol. I have used it for years; in my experience this is the only general treatment of any value, and it often acts like a charm. Even in confluent small-pox the results obtained are unique; no other treatment that I am aware of gives a like result. The earlier the treatment is begun the better: one *must* commence early.

This is the treatment: Xylol, 30 min. four times a day in milk —i.e., 2 drachms a day—for 3 days; then cut down to thrice daily for 3 days; then twice daily for 3 days; then stop. The above is the maximum dose for an adult man of 10 stone or over, and usually 90 min. a day is sufficient; for women of 7 to 8 stone, 20 min. per dose as above; for children, 10 min. per dose; and for babies 5 min. per dose. It may be rather nauseating; if so, give smaller doses more frequently.

How xylol acts I do not know, but it appears to be excreted by and in the skin. Its internal administration causes a flattening of the eruption, prevents suppuration, and reduces scarring to a minimum; toxaemia is greatly diminished and often not present. There is no fetid odour. Recovery is rapid. The pustules often become dry, dark, hard scabs in a few days, and instead of a prostrate patient one finds him sitting up in bed This is no fairy-tale: it is true For success xylol *must* be started early. If begun early this is almost an abortive treatment.

Other essentials are: (1) A darkened room. (2) For face, paint spots with tr. iodi or apply iodex. I do not favour potassium permanganate. (3) For mouth, frequent applications of glycerin of borax. (4) For eyes, wash often with boric or saline solution. Apply 3 times a day acriflavine drops gr. 1/2 to ounce (equals 1 in 1,000). At bedtime, half-strength yellow oxide ointment: never omit this. (5) For scrotum, always support with suspensory bandage and apply fuller's earth or other dusting powder. (6) When rash is drying and scabs are forming, apply iodex with methyl salicylate to face and salicylic ointment *B.P.* to the body. (7) Baths: during convalescence give twice daily.

Xylol treatment is equally effective in severe chicken-pox, and good results have been obtained in cases of pemphigus.—I am, etc.,

Haddenham, Ely, Cambs S. G. S. HAUGHTON,
Colonel, I.M S (ret).

⁂ Xylol in the treatment of small-pox is mentioned in several textbooks on fevers. It appears to have been tried first by Zuelzer in 1871, but fell into disuse. Teissier (*Nouveau Traité de Méd.*, 1922, **2**, 281) warmly recommended it in a total amount of 1 to 2 drachms for adults in the 24 hours, divided into 4 or 5 doses. It is not claimed that it possesses any specific action, but that it arrests suppuration, dries up formed pustules, diminishes cicatrization, and acts as a deodorant. It has no action in primary haemorrhagic or the worst forms of confluent small-pox. In a single epidemic in which Belin of Paris tried the method the fatality rate fell to 12.34%, compared with 31.37% for the hospital before xylol was used. Xylol seems to act by reducing in some degree secondary infection of the pocks, provided that the infection is not overwhelming, as in malignant confluent cases. Its use may be superseded by that of the sulphonamides, under which the skin lesions of small-pox are modified, the septic fever diminished or suppressed, and septic complications and consequent mortality rates reduced (P. B. Wilkinson, *Lancet,* 1942, **2,** 67, and N. N. Chari, *Indian med. Gaz.*, 1942, **77,** 91). In the meanwhile Col. Haughton has done well to record his experience: it is not the first time that a remedy of some efficacy has been forgotten.—ED., *B.M.J.*

What Constitutes Diphtheria?

SIR,—May I claim a little space in your columns to raise a matter which I consider to be of some urgency? I want to ask what constitutes diphtheria. In our medical schools we were taught to look for a very definite clinical picture and to confirm diagnosis by demonstrating the presence of virulent diphtheria bacilli. In practice we have swabbed every sore throat which showed any sort of exudate or membrane, and have, with some justification, bundled off to hospital any case in which the "swab was positive." Among these cases there must have been a number when the illness was caused by some other organism, the patient being a "carrier" of *Bacillus diphtheriae* by virtue of natural or induced immunity. Such cases were exposed to no extra risk by being nursed in diphtheria wards, and it was all to the good that carriers should be "out of circulation" until free of *B. diphtheriae.*

But the widespread immunization of children must have resulted in the wholesale manufacture of diphtheria carriers. This (besides being a pressing reason for immunizing all the others) must also have multiplied the number of cases wrongly diagnosed as diphtheria merely because diphtheria organisms were demonstrably present. It is obviously irrational to treat with diphtheria antitoxin a patient suffering from a streptococcal infection who has repelled threatened invasion by diphtheria organisms actually in contact with his mucosa, and it is undesirable to add to the embarrassment of our overtaxed isolation hospitals.

But another danger, less obvious, is perhaps more important. If we continue to diagnose diphtheria on the evidence of the presence of *B. diphtheriae* in patients known to have been immunized (and probably, if we knew it, Schick-negative) we shall inevitably, and possibly unnecessarily, bring discredit on the efficacy of immunization. What is more, whether we like it or not, the Ministry has put on to the profession the responsibility for advocating immunization (*vide* advertisements in Press, etc.). So it is up to us to see that the public does not get wrong ideas about the value of immunization or of the profession in whose name it is proffered.—I am, etc.,

Swinton, Lancashire. G. D. WILD.

First Aid for Fractured Spine

SIR,—Mr. D. K. Mulvany (Dec. 5, p. 676) has given an answer to Dr. J. C. Matthews's question (p. 677) as to how the first-aider is to diagnose a fractured spine.

A great deal of harm continues to be done by meddlesome first aid, condemned in the St. John Ambulance book but encouraged in many competitions. The first-aider must be instructed not to "mess about." I have too often seen a patient stripped nearly naked in the open air by first-aiders in their search for bruises that do not matter. The first-aid books teach that where a fracture is suspected it should be treated as a fracture, and this applies to fracture of the spine. Severe pain in the vertebral column, with or without shock, is sufficient to justify the suspicion of a fractured spine and the treatment thereof.

The method, details of which I have sent to over 100 correspondents who responded to my former letter, has been justified by many years of practical experience of a not inconsiderable number of actual cases. The title *First Aid to the Injured* needs emphasis. It is the injured person, not his injuries, that is of first importance.—I am, etc.,

THOMAS E. A. STOWELL, F.R.C.S.,
Chairman, Advisory Medical Committee,
Industrial Welfare Society.

14, Hobart Place, S W 1.

Tetanus

SIR,—I am glad that my old teacher, Dr. Leslie Cole, has given us his expert views on this subject in his letter (Dec. 5, p. 678). Perhaps I have had more luck than most people in getting cases with sublethal doses of toxin absorbed from their wounds, in that I always treat injuries, particularly air-raid, garden, and street casualties, with suspicion. I do not suture any penetrating wound, however small it may be, until I have flooded the wound with H_2O_2 and excised the skin edges.

I quite agree with Dr. Cole that some cases are hopeless, whatever you do for them, and I therefore feel that the small amount of added shock produced by excision of the wound at once is justified if it either results in a series of cases with sublethal toxaemia or, better still, prevents the onset of tetanus or gas gangrene.—I am, etc.,

Weybridge JOHN H. HANNAN.

Preparation of the Hands for Operation

SIR,—As one who started a surgical career before the advent of gloves, may I add a postscript to Mr. W. A. Cochrane's article (Nov. 28, p. 635) on the possible absence of gloves and the washing of hands. When I was a dresser our method of washing was as described by Mr. Cochrane, except that we did not use spirit soap and we did not rinse in saline after the washing. All our hands got rough and some of our arms got sore. Perhaps the absence of the saline rinse accounted for this. I do not for a moment wish to cast doubts on the results he describes, but with us, on the firms where hands were used freely, there was, I am sure, a much higher incidence of sepsis than would be tolerated now. In Sir Arbuthnot Lane's wards there was little sepsis, but he used a rigid "no touch" technique. Mr. Rutherford Morison operated inside the abdomen without gloves, wearing them only while making the incision and for sewing up. He said he preferred this, and that the peritoneum had such a good resistance that even a gynaecologist could operate in the abdomen with safety (*pace* the present generation: this was 20 years ago). The moral would seem to be: "No gloves—no touch," except perhaps in the abdomen.

Some bacteriological investigations were done at Guy's on the washing of hands, and they showed that washing in running water reduced the bacteria minute by minute for about 7 minutes, then the count rose again slightly. From smooth hands most, but by no means all, the bacteria could be removed; but once the hands were rough the same degree of cleanliness was quite impossible to achieve. The subsequent lysol or cresol soak made no further reduction. The use of lysol, therefore, was useless, and if, as I think it must have been, it was a roughening factor, it was actually harmful.

As Mr. Cochrane points out, thoroughness, as in everything else, is essential, and basins are probably better to wash in than running water, as soap solution is in itself an efficient antiseptic.—I am, etc.,

Guildford E. W. SHEAF.

Stilboestrol for Cancer

SIR,—On the subject of your annotation on "Diethylstilboestrol for Prostatic Cancer" (Nov. 28, p. 641) I would refer readers to Dr. J. Thomson Shirlaw's letter in the *Journal* of July 27, 1940 (p. 133), in which he quotes Sir Gowland Hopkins as follows: "At one level at least of their organization, living tissues are essentially physical and chemical systems, and it is at this level we must expect to find a basis for the differences displayed by cancer cells and normal cells. Cancer-producing substances (oils, tars), though they differ from them in detail, are yet akin to substances natural to the body—for instance, to the hormones which control certain functions of sex. Subjection to prolonged administration of a sex hormone encourages the growth of glandular cancer."

I will summarize what Dr. Thomson Shirlaw says: we know that the anterior pituitary secretes two hormones—one concerned with growth, the other related to sexual development. They are antagonistic to each other. Stilboestrol has an inhibitory effect on the secretion of the anterior pituitary.

Crystals of stilboestrol implanted into adult rats were found to inhibit body growth and secretion of gonadotrophic hormone. Stilboestrol, 1 mg. twice a day, was given to a man with inoperable cancer of splenic flexure of colon; a week later the tumour could not be palpated.—I am, etc.,

Cambridge. J. A. Vaughan.

An Intractable Cough

Sir,—A patient attended at this clinic with a note from her panel doctor which stated that she suffered from an intractable cough, which was worse at night. The patient gave a history of a cough every winter for many years beginning in November. This winter, 1942, the cough had been worse and much more so for the last two months. She had tried everything she knew of—mixtures, inhalants, and cod-liver oil. The doctor's medicine had eased the cough a little. She was getting "fed up" and desperate. She tried her best to cure the cough. For four nights she had been awake all night. She tried to control the cough by holding her breath. There was no evidence—*x*-ray or clinical—of organic disease of the lungs. On further questioning the patient admitted that the cough frightened her. She was afraid it meant serious disease. She awoke with a dry mouth every morning.

I formed the opinion that the cough was not due to organic disease but to the patient's making a mistake in the way she tried to stop it. The condition was aggravated by the mixed feelings stirred in herself and her husband. The dry mouth in the morning indicated that she was breathing through her mouth, and actual observation showed that she breathed through her mouth habitually before each act of coughing. The cough stirred feelings which aggravated the situation and both frightened and annoyed the patient, irritated the husband, and became a source of argument between them.

I told the patient that no organic disease was discovered in her lungs, and the following advice was given: to take any medicine ordered by the doctor; to breathe through the nose during sleep and before each act of coughing; whenever she felt the desire to cough she should close the mouth and breathe slowly through the nose counting six; she should not think of stopping the cough, or try to stop it by holding her breath; she should let herself cough freely without fear, annoyance, or anger. The patient returned to me the following week and stated that she had used the method advised. She had breathed through the nose before each cough and then found that she did not want to cough. Her mind had also been relieved when informed that no disease was present.

This technique or trick of breathing control was found to be effective on one occasion when a patient was having an artificial pneumothorax refill. He said he wanted to cough. I instructed him to close his mouth, breath slowly through the nose counting six, then open the mouth and let himself cough. The patient obeyed the instructions: closed his mouth, breathed through the nose counting six, then opened his mouth, but did not cough. The habitual use of this method will relieve many dry irritating coughs without either sedatives or expectorants. In other cases reduction in cigarette smoking and in the use of condiments may also be necessary. In all cases the patient is advised to place one hand over the mouth before coughing. This method is of great value in cold, foggy weather.—I am, etc.,

P. A. Galpin,

Chest Clinic, Plaistow, E 13 Tuberculosis Officer

Erythroblastosis Foetalis

Sir,—Prof. Leonard Parsons's plea (Dec. 5, p. 675) for adopting another term for the condition usually described as "erythroblastosis foetalis" should be welcomed for the additional reason that this disease is by no means invariably associated with the presence of an abnormal number of nucleated red blood corpuscles in the peripheral blood. Of the four cases which I saw during the last nine months (with the diagnosis confirmed by the finding of the Rh factor in the infantile and of Rh antibodies in the maternal blood), one, while being intensely jaundiced, had only 0.5 to 1 normoblast per 100 white corpuscles, a number well within normal limits. The term "haemolytic anaemia of the newborn," as proposed by Prof. Parsons, though certainly "better and more accurate," has the disadvantage that it would not cover those cases in which production of red blood corpuscles and haemoglobin keeps pace with the haemolytic process to a degree that anaemia never becomes apparent. Of icterus gravis, erythroblastosis, anaemia, and oedema not one is an obligatory feature of the condition. I should therefore like to propose to call it "haemolytic disease of the newborn"; cases of stillbirth with hydrops foetalis and/or liver derangement may then be classified as "haemolytic disease of the foetus."

While speaking of the "ghastly sequelae . . . which so frequently occur in this disease," Prof. Parsons mentions bone changes. To the best of my knowledge severe bone lesions have so far not been described as sequelae of this condition, but zones of increased and decreased density in long bones were recently described in five cases (three stillborn and two dying within 48 hours after birth) by Follis, jun., *et al.* (1942). These authors quote two other cases (2 and 6), which showed similar lesions, reported by Caffey (1939) in a paper on "Syphilis of the Skeleton in Early Infancy: the Non-specificity of Many of the Roentgenographic Changes."

I should like, however, to present some evidence for the suggestion that a truly ghastly bone disease of so far unknown aetiology is in fact a late sequel to haemolytic disease of the newborn. I am speaking of the conditions described as polyostotic fibrous dysplasia and as Albright's syndrome, of which the latter shows in addition to a polyostotic fibrous dysplasia certain endocrine disturbances and patches of cutaneous hyperpigmentation. In an excellent paper on this latter condition Falconer and Cope (1942), in tabulating the findings in the 25 cases published in the literature prior to their own two cases, noted that four of them were said to have had icterus gravis neonatorum. They state: "Icterus gravis neonatorum has been recorded in only a few cases, although its frequency seems to indicate more than a chance association." Now, as haemolytic disease of the newborn does not always produce icterus gravis, the proportion of cases with such a history may well be higher than 4 in 27; and the fact that this bone disease is self-limited and first noticed in childhood seems also relevant in this connexion. My hypothesis that such severe fibrous dysplasia as is found in Albright's disease may be due to the effect of maternal iso-agglutinins (anti-Rh, anti-A, or anti-B agglutinin) seems further supported by the work of Nettleship (1942), who produced very similar bone lesions in rabbits by injecting them with guinea-pig anti-bone-marrow serum.

Proof or disproof of this hypothesis will fortunately be easy —namely, by examining whether any relevant serological differences can be found between the patient and the mother. I think it would also be worth while to examine radiologically cases known to have had haemolytic disease of the newborn, as one may thereby find symptomless bone changes transitional between the lesions in Follis's cases and in fibrous dysplasia —I am, etc.,

Herbert Levy.

Volvulus of Ileum in a Newborn Infant

Sir,—I should like to put on record a case of volvulus of the ileum in a newborn baby girl. I have looked through the available literature on the subject and cannot find a case recorded.

The infant had a normal birth, and passed meconium once quite soon afterwards, but not again. She began to vomit, first only after feeding and then more frequently. I first saw her when she was two days old, and found her to be crying with pain, refusing to take the bottle, and vomiting even water. The abdomen was a little distended, the umbilical cord appeared healthy, and the little finger could be passed well up into the rectum without encountering any stenosis. With great difficulty the infant was persuaded to take a small barium feed, and screening showed the feed to pass into the stomach, which was pushed up well under the diaphragm. Subsequent radiographs showed the feed to have reached the jejunum, but 24 hours later the meal had advanced no further.

A diagnosis of intestinal obstruction probably due to congenital atresia of the small bowel was made, and operation decided upon the third day after birth. By now the baby was losing ground rapidly, and after a subcutaneous saline required no more than a small dose of cyclonal sodium, 0.005 g., into the anterior fontanelle to provide anaesthesia for laparotomy. To our surprise we found the whole of the ileum completely gangrenous, the peritoneal cavity containing the most offensive fluid. Volvulus of the whole ileum had occurred, twisted at least five times, the axis being the mesentery in the right iliac fossa. The jejunum was distended with barium up to the strangulated ileum. Owing to the distension of the bowel and the state of decomposition it was impossible to determine what developmental abnormality had given rise to this condition. The baby died soon afterwards.

We concluded that the twisting of the ileum had probably started during birth, and that subsequent distension had only served to twist the bowel again and again. It seemed amazing that a baby of this age could be alive at all with an abdomen distended by gangrenous gut and putrid fluid. We also felt that had we been quick enough to recognize the condition on the first day and had decided upon immediate operation we might have saved the child's life.—I am, etc.,

Chelmsford. M. D. SHEPPARD.

Phosphorus Poisoning from Bullet

SIR,—In his article (Dec. 5, p. 664) Mr. A. J. Blaxland remarks that a further antidote for use in such cases would be important. May I suggest that a weak solution of potassium permanganate to oxidize the phosphorus would very likely answer the purpose. The solution would have to be weak as the reaction is violent, and would probably be best given by the continuous drip method.—I am, etc.,

Stoke Poges. W. L. PEACOCK

Medical Planning

SIR,—The Medical Planning Commission has presented us with a very comprehensive survey of the present position of medical work, but I cannot help feeling that it has not so clearly defined the foundations on which to build a sound practice of medicine. Medicine to-day is a large subject, and therefore it is necessary for its practice to be classified into workable departments.

In approaching this subject I think it is desirable to assess what is good in the present system. For my part I cannot imagine the British public yielding its freedom in such a personal matter as health to full bureaucratic control; neither can I see the British public shopping for health at chain medical stores, such as are envisaged. In short, any scheme which does not adopt the family doctor as its basis must fail, and any scheme attempting to dispense medical service without an individual doctor accepting direction for a particular patient must lead to chaos.

Still all is far from well in the world of medicine, since facilities are not available for all doctors to practise their profession up to the extent of medical knowledge. Too much is made of "opinions" when it is "facts" that are wanted. Facilities for acquiring "facts," such as are forthcoming from *x*-ray investigations, biochemical tests, etc., are a prime necessity in any scheme. Medicine could perhaps be put on a workable basis by classification into two departments: (1) practical medicine; (2) social medicine.

1. Practical medicine might be defined as that part of our science which pertains mainly to the individual, and all aspects concerning the health of the individual should be carried out by, or planned in association with, the general practitioner. Here preventive measures should hold a prominent place. It seems to me desirable to do away with the term "preventive medicine"; its association with public health has led to a false differentiation in the mind of the physician, and particularly is this true of the minds of our teachers of medicine. If prophylactic measures were an integral part of practical medicine their application would become automatic.

To carry out such a conception of practice I would suggest nationalization and co-ordination of all hospitals with mainly whole-time staff. A department of the principal hospital should be available as a diagnostic and specialized treatment centre for the use of practitioners in the area served by the hospital. A health centre, including ten doctors, could not be equipped economically to meet all requirements of diagnosis, etc., and therefore, though an improvement on the present situation, would not be a solution of our difficulties.

The general practitioner might be left as at present to start with, but having the hospital facilities outlined above. He would be working an improved panel system which might be more economically conducted by a State Department. Since 90% of our population will soon come under State medical control it is idle to discuss State Medical Service; our concern is rather with the best method of carrying out medical practice.

2. Social medicine, on the other hand, covers the whole realm of collective medicine and cannot possibly be incorporated in any scheme of practical medicine. Those responsible for social medicine are in a different category: their associations and endowments of authority could not be vested in every medical practitioner and made workable. As a possible plan I would suggest that social medicine be a whole-time State service. It involves most departments of civil administration, and can only be properly co-ordinated as a State Department. Its object would be positive health in the political sense—the welfare of the State—and include housing, conditions of work in the factory, epidemic control, statistics, etc. In this connexion I feel that school medical inspection and services for tuberculosis, venereal diseases, fevers, and possibly maternity services, are more perfectly administered and conducted under social medicine than under a diffuse system in medical health centres. These services have a collective social character requiring specialization if they are to be effectively carried out.

All specialized and diagnostic facilities should be open to all members of the community. After a period of 5 or 10 years general practice could be reviewed and then more aptly coordinated in a comprehensive scheme. Consultant work and research could be adapted within the scheme suggested. I should perhaps elucidate the standpoint taken on the term "preventive medicine." To me this term suggests insurmountable inimical forces against which the public must be protected—surely a negative attitude. "Positive health," on the other hand, must mean not only the health of the individual but also his environment. It stands for a positive basic approach to health, and involves in its achievement dealing with those inimical factors whether they be of the individual or the social order. This is more than tilting at nomenclature; it is a question of concept.

This very general outline offers the basis of a scheme wherein every practitioner would acquire "the tools" for his particular "job."—I am, etc.,

Southport. S. H. STEWART

Reporting of Deaths to Coroner

SIR,—I was interested to read the letter on this subject from Dr. W. B. Purchase (Dec. 5, p. 677). The possibility of some confusion of thought, to which Dr. Purchase rightly draws attention, is increased by the fact that neither the full text of counsel's opinion nor the letter upon which he was asked to advise has been published. I have hesitated previously to enter your correspondence columns in relation to this subject, both because I am the coroner whose letter to the hospitals was the subject of counsel's opinion and, not less, because the opinion of counsel appeared to me fully to support the legal position set out in that letter. There is, however, an important misconception which has crept into the matter, and which is not entirely removed by Dr. Purchase's letter.

My letter was, as Dr. Purchase points out, a request that certain deaths should be reported to me. To this request was added a statement that in certain classes of deaths (including those within 24 hours of an anaesthetic or operation) there was a duty at common law to report to the coroner. The opinion of counsel entirely supports this view of the common-law duty of medical practitioners. My letter then went on to say that it was desirable that certain other deaths should be reported, including those within 24 hours of admission to hospital. I did not, and of course could not, suggest that there was any legal duty on the part of medical practitioners to report this latter class of case to the coroner.

I am anxious to clear up any misunderstanding that may exist about the two classes of cases, more particularly as the necessarily compressed article in the *Supplement* of Sept. 12 does, I think inadvertently, convey the impression that I had drawn no distinction between them. The unabridged copy of counsel's opinion, which I have had the advantage of seeing, does draw the necessary distinction.

I am of course in entire agreement with Dr. Purchase as to the desirability of co-operation between the medical profession and the coroner in these matters.—I am, etc.,

CYRIL BARON,
H.M. Coroner, County of Surrey, Eastern Division.

Pasteurization of Milk

Sir,—The Poole Borough Council, on the recommendation of its medical officer of health, has just adopted a resolution asking the Ministry of Health to pasteurize all milk intended for human consumption. I hope local authorities throughout the country will look into the condition of their milk supplies, and will likewise press the Ministry to take action in this important matter.

I have before me the latest quarterly report of the milk inspector of one of our important agricultural counties, which I have reason to believe represents in some approximate degree the average throughout this country. Out of 758 samples taken *from farms* in the county, 384 were unsatisfactory—i.e., over 50%. Out of 73 samples taken *from depots* where milk is collected, 57 were unsatisfactory—i.e., about 75%. From depots the milk goes to a variety of distributors. What deterioration takes place in their hands is not recorded. Perhaps it is just as well. In the same report it is stated that 62 samples of milk were taken for examination for the presence of tubercle bacilli, during the quarter, under Section 68 of the Food and Drugs Act, 1938. No results were given. The omission is very significant. One's mind turns to the free and subsidized distribution of crude milk to our young scholars and children generally under State direction, and to the recent increase of tuberculosis, and it becomes abundantly obvious that urgent measures are needed without delay to remedy a really serious menace to public health.

Poole Borough was seriously affected by the milk-borne outbreak of typhoid fever in 1936, and is still therefore milk-conscious. The Ministry of Health performed most meritorious service in connexion with that outbreak. Pasteurization may not be a perfect answer to the demand for a healthy and wholesome milk supply, but it is a ready and effective one. Even if it does deprive milk of a small percentage of food value, it ensures comparative safety.—I am, etc.,

J. Ross MacMahon.

Bournemouth.

⁂ A leading article on pasteurization of milk appears at p. 727.—Ed., *B.M.J.*

Control of Venereal Diseases

Sir,—I welcome your leading article (Nov. 21, p. 611), which I assume is an expression of disappointment with Defence Regulation 33B. It is difficult to see how the regulation can make much advance in the control of infections in the civilian population, which are increasing rapidly. In any case, no one (including the Ministry of Health) has any accurate knowledge of the incidence of these conditions in this country; surely that is the first question to tackle, and notification seems to me the only way to do it.

As regards comparison with other countries, I doubt exceedingly whether Dr. Margaret Rorke is right in suggesting that there is not the same sense of shame associated with V.D. in Scandinavia as still exists in this country, and unless we are prepared to change our moral ideas completely I suggest that it is a good thing that, in most cases, such a sense of shame should still exist. Neither am I prepared to accept Major S. M. Laird's 2.5% defaulter rate which he quotes for Sweden. One would need much more information as to how the figures were compiled; for a default rate of 2.5% means that for practical purposes default in Sweden is negligible and Utopia has been reached.

I, for one, am not among those who think that the present V.D. scheme in Britain is a failure; on the contrary, I am convinced that in many ways it has been a great success, but undoubtedly it can be improved, particularly by better education of our own profession. Heaven forbid that I should suggest additional compulsory examination in V.D. for final-year students, but I am sure that the ignorance to be seen, even to-day, in all classes of the medical profession is a very great contributory factor in the spread of these important diseases.

I think that the Ministry of Health or the General Medical Council might encourage the study of venereal disease by perhaps giving an annual prize—say of £10—to be awarded as the result of a voluntary examination for final-year students at each of the universities. I believe the money would be well spent.—I am, etc.,

E. W. Assinder.

Birmingham

Obituary

RUSSELL JOHN HOWARD, C.B.E., F.R.C.S.

The London Hospital has lost one of its best-remembered men in the death of Mr. R. J. Howard—"Russell John" to his colleagues—which took place on Dec. 4. He had been associated with the London Hospital as student, teacher, and member of the visiting staff for not far short of half a century, and was regarded by all with esteem and affection.

Russell John Howard was born in January, 1875, and educated at King's College School, London. He entered the London Hospital as a student in 1895, and graduated M.B.Lond., with first-class honours and the gold medal in medicine and forensic medicine, in 1899. He served as house-surgeon at "The London," and as demonstrator of anatomy at the medical college, also as surgeon to out-patients at the Royal Waterloo Hospital for Women and Children. Choosing general surgery as his department of practice, one for which he was excellently endowed, he took the M.S., again winning a gold medal, in 1903, and the F.R.C.S. in the same year. In 1908 he was elected to the honorary staff of his hospital, and there, alike for his ability in surgery and for his personal qualities, he built up a great reputation as surgeon—ultimately becoming senior surgeon—and as teacher. For teaching, Howard had exceptional gifts. Even after his retirement from the staff of the hospital three years ago on reaching the age limit he still continued to lecture to the students on surgery and on surgical nursing, the latter a subject to which he had devoted particular attention. It is fitting that on the walls of the college his portrait, beside those of Treves and others, should show him, not in academic robes, but in his more familiar white coat, giving a lecture.

Among other posts which he held were those of examiner in surgery for the Royal College of Surgeons, and examiner in nursing at Westminster Hospital, and he did good work as surgeon to the Poplar Hospital for Accidents. He also carried on a large consulting practice in Queen Anne Street, and he wrote a number of textbooks bearing such titles as *Practice of Surgery, Surgical Nursing, Surgical Emergencies,* the last a highly commended book published in 1924, and *House Surgeon's Vade Mecum.*

In the early part of 1939, in the emergency arrangements of sectors for the hospitals of London and the Home Counties, Russell Howard, as senior surgeon, was made head of the sector which has the London Hospital as its base. His retirement from the honorary staff of the London took place later in the same year, and was made an occasion by staff and students, past and present, for expressing appreciation of his outstanding work, his ever-ready helpfulness, and his modesty. In the report of the House Committee to the Court of Governors he was described as an eminent surgeon and an exceptional teacher. A fellow-surgeon who had been associated with him for seventeen years said how happy he would be to work under him as chief for another seventeen. He was described as an "institution" of the London, one who had exercised a profound influence on generation after generation of students and nurses; while as for his medical colleagues, he was one of the great promoters of professional amity, able to rub away any rough edges which may develop among men working together, and to make the staff into something resembling a happy family. In "London" men, wherever they might be, and however remote or recent their connexion with the Mile End Road, he took an immense interest. For many years he was treasurer of the Hospital Clubs Union, to which he gave long and untiring service, particularly in the raising of the funds for a new pavilion at Hale End. At the end of the last war he was made a Commander of the Order of the British Empire.

Dr. **Henry Ingeldew Daggett** died at Boroughbridge, Yorks, on Nov. 7, aged 78. He studied medicine at the University of Cambridge and at St. Mary's Hospital, graduating M.A., M.B., B.Ch. in 1890. Before setting up in practice at Boroughbridge fifty years ago he had held house appointments at the Nottingham General Hospital. Dr. Daggett joined the B.M.A. in 1893, was chairman of the Harrogate Division in 1927-8, and served as its representative at the Annual Meeting of the Association in 1906. He was also a past president of the

Harrogate Medical Society, and an honorary life member of the St. John Ambulance Association. On his retirement from active practice in 1931 he received a public presentation from his friends and patients. His son, Mr. W. I. Daggett, F.R.C.S., is surgeon to the nose and ear department of King's College Hospital.

Medical Notes in Parliament

Bagassosis

Mr. **Herbert Morrison** said on Dec. 3 that he had received from medical inspectors of factories reports on the condition described as bagassosis, caused by the inhalation of dust from cane fibre or bagasse (see *British Medical Journal*, Oct. 24, p. 478, and Nov. 14, p. 577). It was now being considered by the Medical Research Council. Pending this investigation action could not be considered, but inquiries suggested that the condition was not suitable for inclusion in a scheme of compensation on the lines of the schemes for silicosis and other forms of pneumoconiosis.

Supplementary Medical Service of Scottish War Workers

On Dec. 8 Mr. **Pethick Lawrence** asked the Secretary of State for Scotland whether he had extended the area of the experiment in diagnosis and treatment of workers initiated in the Clyde Valley. Mr. **Johnston** replied that the supplementary medical service which had operated in the Clyde Valley since January last had now been extended to cover workers of all ages in the industrial areas of Scotland. He had the entire concurrence of the doctors in this matter. The first experiment covered 44% of the insured workers. Replying to Dr. Summerskill, who asked if the extension included dependants, Mr. Johnston said it dealt with workers. Dr. Summerskill asked if a housewife was a worker, and Mr. Johnston said she was if she was a war worker. He also told Mr. McNeil that he was absolutely satisfied that there were sufficient beds to meet all kinds of cases referred for hospital treatment under this scheme.

Small-pox and Vaccination in Scotland

On Dec. 8 Mr. **Viant** asked the Secretary of State for Scotland in how many cases in the recent vaccination campaign in the Methilhill district was vaccination carried out in several insertions in violation of the instructions issued to public vaccinators. Mr. **Johnston** said that the instructions to which Mr. Viant referred did not apply to Scotland. The recommendations on technique issued by the Department of Health for Scotland included scarification with three strokes one-eighth of an inch apart, but these recommendations were not legally binding. It was not known in how many cases this recommendation was carried out by doctors.

Mr. Johnston added that he was aware that some of the original cases of small-pox at Methilhill were at first diagnosed as chicken-pox by the assistant medical officer called in by the medical attendants. He was advised that the diagnosis of small-pox in its early stages was not always easy.

In reply to another question Mr. **Johnston** said that according to the information at present available there had been 9 deaths in Scotland following vaccination during the recent outbreaks of small-pox, when about 1,000,000 vaccinations were performed. Seven of these were registered as due to encephalitis (2 in Glasgow, 3 in Edinburgh, and 2 in Fife), 1 in Glasgow due to erythema, and 1 in Lanarkshire due to toxaemia. In addition, there was 1 death in Glasgow due to measles, vaccination being stated to be a contributory cause.

Compensation for Pneumoconiosis

The Workmen's Compensation Bill was set down for consideration in the House of Commons on the next sitting day after Dec. 3. This Bill proposes to extend Section 47 of the Workmen's Compensation Act, 1925, to workmen suffering from pneumoconiosis and to provide for the payment of benefit in the case of such workmen; to enable the Treasury to contribute to certain medical expenses; to amend certain provisions of the Coal Mines Act, 1911, relating to siliceous rock; and to amend the provisions of the Workmen's Compensation Acts, 1925 to 1941, relating to examining surgeons. The term "pneumoconiosis" is defined as fibrosis of the lungs due to silica dust, asbestos dust, or other dust, and includes the condition of the lungs known as dust-reticulation.

In the House of Commons on Dec. 8 Mr. **Peake** moved the second reading of the Workmen's Compensation Bill, which, he said, made provision for an industrial disease that had been the subject of an inquiry begun by a committee of the Medical Research Council in 1936. The committee's investigations had established a form of pneumoconiosis which differed from silicosis and could not be said, on present information, to be due to silica dust. It could be distinguished by both radiological and pathological methods, and was due to inhalation of air-borne dust in the course of employment. It was found to exist not only in the anthracite area but throughout the South Wales coalfield, though incidence and severity varied greatly in different regions. It was also found in surface workers employed on the screens, and in coal-trimmers in the dockyards of South Wales. There was confirmation of this from the Silicosis Medical Board, which had examined cases from other coalfields similar to those found in South Wales. In the mines the root cause of the trouble was the dust inevitably produced in the normal process of getting coal, and was accentuated by shot-firing.

Clause I extended Section 47 of the Act of 1925, which enabled compensation schemes to be made for fibrosis of the lungs due to silica dust or asbestos dust, to any form of pneumoconiosis. It would enable a unified compensation scheme to be made for silicosis and pneumoconiosis. The liability for compensation in respect of future cases would fall on the individual employer. Clause 2 enabled a benefit scheme to be made for dealing with cases of men who had already left the industry since the comprehensive scheme for silicosis in coal mines was introduced in 1934 but who had no right to compensation. It was proposed to pay 15s. a week in addition to national health insurance benefits in cases of total incapacity, and a death benefit to a widow at a flat rate of £250.

Under Part II of the Act of 1925, in the case of industrial disease, a certificate of disability could be granted only by the examining surgeon for the district in which the disease was contracted and the workman was employed. Directions would now be given which would empower an examining surgeon in the district in which a workman might be residing to give the necessary certificate.

Mr. **David Grenfell** expressed a hope that out of the scheme provided in Clauses I and II there would come a regularly constituted board with a fund, financial resources, medical advice, and a clinical organization. Mr. **Isaacs** said that the clause which allowed the Home Office certifying surgeon to certify in the district where a man happened to be living was a very valuable concession.

National Service: Earlier Enrolment of Youths

In the House of Commons on Dec. 8 Mr. **Ernest Bevin** moved the second reading of the National Service Bill. He explained that the Government did not intend to lower the age of liability to military service below 18, but the military situation was such that it was necessary to make it possible to enrol young men at 18. At present it was from 18 years and 4 months to 18 years and 6 months before a person liable at 18 could be enlisted, and it was necessary to have a Proclamation and registration and medical examination after reaching 18 years of age. The Bill provided that all these preliminary steps should take place at 17 years and 8 months. It might well be necessary, as the war progressed and casualties occurred, to go up into the higher age limits, but the Government desired to avoid that as much as possible. Experience showed that it took about four age classes at the upper end of the scale to give the same number as one class at the lower end. That was mainly due to reasons of health and to physical capacity of the people called up.

Mr. **John Dugdale**, speaking of the medical inspection of the boys who were called up, said he served for some months in a young-soldier battalion. These men were volunteers, but some of the medical inspections were nothing short of ludicrous. At least 10% of the boys who came into the young-soldier battalions were totally unsuited to go into the Army at all.

Mr. **Harvey** asked for an assurance that where a university student was in the academic year in which he would become 18, if his work was satisfactory and he had a certificate to that effect from the proper authority, he should be able to complete the academic year.

Mr. **McCorquodale**, replying to the debate, said it would not be possible to defer calling up beyond June, 1943, to enable boys to take a course of study in arts at the universities. In the present strenuous and serious position of the war, they could not continue those courses. They were continuing to make arrangements for the reservation of boys accepted as medical and dental students. The Bill was read a second time by 267 votes to 5.

False Certification and Criminal Proceedings

Sir **Donald Somervell**, replying on Dec. 9 to Sir Jocelyn Lucas, said the Director of Public Prosecutions made a full investigation in 1940 into the activities of a doctor who was recently struck off the *Register* for giving bogus certificates to men to enable them to evade military service, and into other similar cases. It was decided then that the available evidence did not afford a basis for criminal proceedings. Since Sir Jocelyn put his question down inquiries had been made to see whether the position had altered so far as evidence for criminal proceedings was concerned. Sir Donald did not think it had. He added that as a result of the investigation in 1940 a Defence Regulation was made strengthening the law on the subject. This was not applicable to acts done before it was made.

School Medical Inspection.—Mr. Lipson on Dec. 3 asked Mr. Butler to withdraw Circular 1604, which recommended curtailment of medical inspection of children in elementary schools. Mr. **Butler** said he could not do so. The medical man-power position necessitated the recommendations made in the circular. He regretted that in some areas the staff was insufficient to carry out the full programme of medical inspection.

Diet of Tuberculous Persons.—Mr. Brown stated on Dec. 3 that the special dietary needs of tuberculous persons had been considered by the medical committee, including medical officers of the Ministry of Health, which advised the Minister of Food. Persons with active tuberculosis had a priority right to an extra allowance of milk, but limitations of supply and the needs of others did not at present permit an extra ration of eggs to tuberculous persons nor provision of extra milk for their contacts.

Notes in Brief

The number of cases of non-pulmonary tuberculosis notified in the County of London was 1,281 in 1938 and 903 in 1941, representing a decrease of 29.5% between those two years. Deaths from tuberculosis among children under 15 years of age in the administrative county of London numbered 197 in 1938 and 220 in 1941—a 12% increase.

Universities and Colleges

UNIVERSITY OF LONDON

G. A. R. Kon, M.A.Camb., D.Sc.Lond., has been appointed as the first occupant of the University Chair of Chemistry tenable at the Royal Cancer Hospital (Free), which was instituted just before the outbreak of war. Dr. Kon has been a member of the staff of the Imperial College of Science and Technology since 1925, the title of Reader in Organic Chemistry being conferred on him by the Senate in 1935.

ROYAL COLLEGE OF SURGEONS OF ENGLAND

The following candidates were successful in the recent Primary Fellowship Examination:

R. C. Barclay, H. W. A. Baron, M. S. Brett, J. B. Brierley, A. E. Carter, J. C. Dundon, N. Gillman, M. Harty, H. G. S. Korvin, R. W. P. Mellish, S. Muntarbhorn, W. S. Peart, J. H. Penrose, P. F. Philip, A. F. Robinson, Mary G. Shaw, O. L. Wade, Christine M. Weddell, W. R. Welply, F. R. Wilde.

ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW

At a meeting of the Royal Faculty of Physicians and Surgeons of Glasgow, held on Dec. 7, the President, Mr. J. H. MacDonald, in the chair, the following were admitted Fellows of Faculty *qua* Physician:—J. Black, M.B., C. Borg, M.D., G. G. Browning, M.B., A. J. V. Cameron, M.B., G. M. Currie, M.B., D.P.H., A. Dunn, M.B., D.P.H.; H. B. Young, M.B., Ch.B.; D.P.H., was admitted a Fellow of Faculty *qua* Surgeon.

The Services

The King has approved the publication of the name of Lieut. (Temp. Capt.) K. I. H. Henry, R.A.M.C., as having been commended for brave conduct.

Prob. Temp. Surg. Lieut. G. H. Murray, R.N.V.R., has been mentioned in dispatches.

CASUALTIES IN THE MEDICAL SERVICES

Temp. Surg. Lieut. **Alfred Leigh Phillips**, R.N.V.R., is reported "missing, presumed killed" on active service last month. He was the son of Dr. F. E. and Mrs. Leigh Phillips of Milton, Berks, and graduated M.B., B.Chir. of the University of Cambridge in 1939. After holding a post at the Victoria Hospital for Children, Chelsea, he entered the R.N.V.R. in April, 1941.

Prisoners of War.—War Subs. Capt. R. W. Doyle, R.A.M.C., Lieut. B. I. Evans, I.M.S., War Subs. Capt. B. F. B. Gulliver, M.C., A.M.C., Acting Major T. McLardy, R.A.M.C., War Subs. Capt. McQuillan, R.A.M.C., War Subs. Capt. F. J. D. Webster, A.M.C.

DEATHS IN THE SERVICES

Major-General **Howard Ensor**, C.B., C.M.G., C.B.E., D.S.O., late R.A.M.C., died on Nov. 22 at the age of 68. He was educated at Trinity College, Dublin, and graduated B.A. in 1895 and M.B., B.Ch. in 1897, in which year he also obtained the L.M. of the Rotunda Hospital. Before joining the regular Army he was in the West African Frontier Force. He served in the South African War with the R.A.M.C., receiving the D.S.O., the Queen's medal with four clasps, and the King's medal with two clasps. In 1902 he was seconded to the Egyptian Army and did excellent work in the Sudan, being awarded the Order of Osmanieh in 1910 and of the Medjidieh in 1912. After promotion to the rank of major he was restored to the British establishment and served with much distinction in the war of 1914-18, being mentioned six times in dispatches, promoted brevet lieut.-colonel, and awarded the C.M.G. He became substantive lieut.-colonel in 1915, colonel in 1925, and major-general in 1929. For the next four years he was D.D.M.S. Eastern Command, and honorary surgeon to the King 1930-3; in 1937 he was appointed Colonel Commandant of the R.A.M.C. He had been awarded the C.B. in 1923 and the C.B.E. in 1928. General Ensor was a member of the B.M.A. and had served on the Egyptian Branch Council.

Col. **George Washington Brazier-Creagh**, C.B., C.M.G., late R.A.M.C., died in London on Oct. 10. He was born on June 20, 1858, and was educated at Trinity College, Dublin, where he took the L.Med. and L.Ch. in 1880. Entering the Army in 1881, he became lieut.-col. after twenty years' service, and retired in 1911. During his service he conducted missions to South-East Persia in 1893-4; to Seistan, Persia, in 1896-7, making extensive explorations of little-known regions throughout Eastern Persia and Baluchistan, and opening up the Seistan-Nushki trade route, being thanked for his work by the Government of India. He took part in the Punjab frontier expedition of 1897-8 (medal and clasp); accompanied the Peking syndicate throughout North China in 1898-9; served throughout the South African War of 1899-1902, taking part in the relief of Ladysmith, including the actions at Tugela Heights, Vaal Krantz, Spion Kop, and subsequently in operations in Natal, the Orange Free State, and the Transvaal, being three times mentioned in dispatches. He received the Queen's medal with six clasps and the King's medal with two clasps, and was appointed a C.M.G. in 1901. He rejoined for service in the war of 1914-18 and was promoted col. in 1919. He served in France and Flanders as A.D.M.S. of the 39th Division, was mentioned in dispatches four times, and was appointed a C.B. in 1917.

Medical News

A gift in kind of drugs to the value of £1,015 has been made to Mrs Churchill's "Aid to Russia" Fund by Lord Trent on behalf of Boots Pure Drug Co. Also as a gift to this fund the employees of George Gill and Sons (Sheffield), Ltd., in their own time are replacing 500 Spencer Wells forceps valued at £100 and lost by enemy action.

Sir Bernard Spilsbury has been appointed honorary treasurer of the Medico-Legal Society, in place of the late Sir Walter Schroder.

Dr. M. T. Morgan, medical officer of health for the Port of London, has consented to act as consultant to the Ministry of War Transport on questions affecting seamen's health.

Dr. W. St. John Cogan has been appointed a justice of the peace for the County of the City of Edinburgh.

Dr. Jean-David Buffat has succeeded the late Prof. Jean Rossier as director of the Surgical Clinic at Lausanne.

Persons suffering from certain skin diseases may buy "household type" rubber gloves without a permit if they have a medical certificate stating that they are suffering from long and intractable eczema, or cheiropompholyx, or intractable dermatitis, and need these gloves for their household duties.

Fifty per cent. of the inhabitants of Central and Eastern Finland and from 2 to 30% of the inhabitants of Western and Northern Finland are infested with *Dibothriocephalus latus* owing to the consumption of raw and badly salted fish.

Medical officers of health are now asked to send to the Ministry of Health, in accordance with Public Health (Tuberculosis) Regulations, 1942, the necessary particulars concerning women born in the year 1922 who have a history of tuberculosis. The information should be supplied as before on Form T.147(W).

Dr. William Chisholm, who was on board a ship in the Merchant Navy which was sunk by a torpedo, is reported to be missing.

A recent conference called by the Hospital Almoners' Association to discuss a survey of the almoner's work in hospitals to-day which had been prepared at its request agreed that the almoner's most important function—her medico-social work among patients—was often either overlooked by committees of management or seriously limited by far too many clerical duties. Only those administrative duties, it was considered, which affected the welfare of the patients should be done by the almoner's staff. Both the Ministry of Health and the subcommittee of the Royal College of Physicians which has under consideration the teaching of social medicine to medical students recognize the contribution to be made by almoners in this field. The former has asked the profession to draft plans of the part practising almoners can take in this instruction, while the Royal College has asked for outlines of an almoner's model unit in a hospital to facilitate the teaching and the practice of social medicine.

A Joint Council of Professional Scientists, representing over 10,000 qualified scientists, has been set up under the chairmanship of Sir Robert Pickard, F.R.S., by the Institutes of Chemistry and Physics in association with representatives of professional botanists, geologists, mathematicians, and zoologists. It has been established for the period of the national emergency, but it may form the nucleus of some more permanent organization to facilitate the close collaboration between professional men and women practising in all branches of science. Communications to the Council should be addressed to Dr. H. R. Lang, honorary secretary, Joint Council of Professional Scientists, c/o the Institute of Physics, at its temporary address, the University, Reading, Berks.

It is reported that the total area under cultivation with medicinal plants and herbs in the German Reich amounted in 1941 to about 40 square miles. Of this about 5 square miles is in the newly acquired territories.

EPIDEMIOLOGICAL NOTES

Discussion of Table

In *England and Wales* during the week the incidence of measles rose by 1,833 while the notifications of diphtheria fell by 140. Dysentery notifications went up by 46, and further rises were reported in the other infectious diseases.

Small increases in scarlet fever were fairly general throughout the country, the largest being 38 and 32 for Essex and Surrey. But in Yorks West Riding there was a decline of 67 cases.

There were fewer notifications of diphtheria in most counties, the only notable drop occurring in Lancashire, where there were 38 fewer cases than in the preceding week.

There were 29 and 23 fewer cases of whooping-cough in Middlesex and Yorks West Riding, and 22 more in Staffordshire.

The notifications of measles are still higher in the North than in the South. The largest rises were Yorks West Riding 527, Lancashire 373, Wales 245, Leicestershire 197, Nottinghamshire 119, Southampton 102. Despite the upward trend throughout most of the country, a fall in the notifications was recorded in Derbyshire 117, and London 55.

The only new outbreak of dysentery during the week was from Derbyshire, 26 cases (Belper R.D. 25, Ashbourne R.D. 1). Increases occurred in the existing widespread outbreaks in Lancashire, from 24 to 32 cases, and in Surrey, from 7 to 18 cases. In Lancashire six administrative areas were involved, with the principal centre in Manchester C.B., 14 cases; and in Surrey the cases were recorded from five areas, the largest total being Banstead U.D. 11. In London there were 14 cases (a decrease of 4) in ten boroughs.

In *Scotland* there were still further rises in the incidence of measles and whooping-cough, but diphtheria and scarlet fever are on the downgrade. Measles went up sharply from 80 to 139 in the city of Dundee.

In *Eire* the most notable feature of the returns was the sudden fall from 25 to 5 in the weekly number of cases of poliomyelitis; this was the lowest total since the week ending Aug. 22, when the outbreak began. Notifications have averaged just over 20 a week during the past three months. There has been a further case of typhus in the rural district of Galway, Co. Galway.

Small-pox

After an interval of eight days without a case 5 more cases of small-pox have been reported from Edinburgh: in 3 of these the patients belonged to one family, and 1 woman of 58 died after admission to hospital, thus bringing the deaths in Edinburgh up to 6.

Returns for the Week Ending December 5

The notifications of infectious diseases in England and Wales during the week included: scarlet fever 2,900, whooping-cough 1,195, diphtheria 1,011, measles 11,205, acute pneumonia 890, cerebrospinal fever 73, dysentery 191, paratyphoid 5, typhoid 4.

No. 47

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended Nov. 28.

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for: (a) England and Wales (London included). (b) London (administrative county). (c) Scotland. (d) Eire. (e) Northern Ireland.

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for: (a) The 126 great towns in England and Wales (including London). (b) London (administrative county) (c) The 16 principal towns in Scotland. (d) The 13 principal towns in Eire. (e) The 10 principal towns in Northern Ireland.

A dash — denotes no cases; a blank space denotes disease not notifiable or no return available.

Disease	1942					1941 (Corresponding Week)

B.M.A. SCOTTISH OFFICE: 7, Drumsheugh Gardens, Edinburgh.

QUERIES AND ANSWERS

Wartime Diet and Miscarriage

Dr H. W. H. HOLMES (Burnham-on-Sea) writes: With reference to your article, " Wanted: A Nutrition Policy " (Nov. 28, p. 640), is there any indication that the present wartime diet has any effect on miscarriages, which seem to be taking place in an unusually large number, and how can it be rectified?

Dressing for Cancer of Breast

Dr. W. G B. HALLIDEN (Stroud) writes: In answer to " Deodar " (Nov. 28, p 654) I would suggest the daily application of a liberal quantity of sulphanilamide powder This can be dusted on straight from the container and a dressing of liq. paraffin or liq. paraffin and eusol emulsion applied. I have found with this treatment that the ulcerating area shows a healing tendency, the discharge diminishes, and a marked deodorizing effect is obtained.

" INOFFENSIVE " writes: A mixture of charcoal and iodoform will prevent the smell. This can be used as a powder or made into an ointment, and 5% or less of iodoform will suffice.

" M " writes to say that " Deodar " will find eusol effective

Income Tax

Liability to Tax

" Colonial " arrived from abroad, on leave, in this country on Oct. 10, 1942. He has no permanent residence here. He inquires as to the circumstances in which he may become liable to British income tax.

⁂ It is assumed that he has not paid habitual but only occasional visits to this country in recent years. The statutory rule provides that a person who is resident abroad and comes to the United Kingdom is *not* liable for tax if he is here for some temporary purpose, without the intention of establishing his residence here and his stay does not last for a period of six months in any one financial year. It follows, therefore, that " Colonial " cannot be regarded as a British resident until Oct. 5, 1943—as the present financial year ends on April 5, 1943—unless in the meantime he forms the intention of establishing his residence here If he does become liable as a resident he will be assessable *for the year* in which he becomes liable, but not in respect of pay not remitted to the United Kingdom.

LETTERS, NOTES, ETC.

Adequate Vaccination

G. D. G. (Dalkeith) writes: Sir Alexander Macgregor and Dr. Peters refer in their article on the 1942 outbreak of small-pox in Glasgow (*Journal*, Nov. 28, p. 627) to unsuccessful vaccinations and revaccinations. Frequently people say they have " been done " but as it never took they suppose they are immune; this is a widespread fallacy. I have received a letter from a retired matron of Indian Government hospitals who says: " I have been in the throes of vaccination. In India I used to be done every year but it never once took I was done last July by a doctor on the Edinburgh M.O.H.'s staff without result, so when small-pox started I was again unsuccessfully vaccinated The doctor told me to come up again to see him in a week. This time a lady doctor did me and it took very well. This is the first time in all my life that it has taken at all. I was always told I was immune but never believed it." A weak spot in the Vaccination Order of 1929 was the direction given to public vaccinators to make a single linear incision instead of the scarification hitherto practised. In [illegible] Glasgow outbreak the single-stroke technique was discarded and three incisions were adopted as the standard practice A single unsuccessful vaccination was not accepted as evidence of immunity There is room yet for more attention being paid to *adequate* vaccination. The lack of this adequacy has given the conscientious objector a weapon to hammer against this wonderful measure for securing small-pox immunity.

First-aid Treatment for Fractured Spine

Dr. A. R. NELIGAN (Droitwich) writes: I agree with Lieut.-Col. J. L. Moir (Oct. 31, p. 529) about the need for a simple standard method. I suggest that the following way of lifting men on to the stretcher is better even than his five bandages, if only because poles will not always be handy. Four bearers: one for the head, one for the legs, one on each side of the trunk grasping the tightly rolled edges of the unbuttoned blouse (or jacket) with hands as far apart as possible. Untrained men can lift a heavy patient easily and correctly in this way; he lies, as it were, in a hammock but with no sagging, and can be moved with very little disturbance.

Lieut-Col. J. L. MOIR (Anglesey), in the course of a further letter, states that in order to distinguish his method for the first-aid treatment of fractured spine (*Journal*, Oct. 31, p. 529) from others it has been decided to call it the Clarke-Moir method, and he will bring it to the notice of the B.R.C.S. and the Orders of St. John and St. Andrew. But before doing this, as the matter is of considerable importance, he is referring the method to the British Orthopaedic Association for their consideration and approval or otherwise. He continues: Dr. J. L. McKenzie Brown, First-aid Commandant, Civil Defence Service, Walthamstow, wrote me that he thought Procedures VI and VII in the order of my treatment should be transposed—that is, the lower limbs should be tied together by triangular bandages *before* the patient is turned on his back. We quite agree with this, and think this alteration should be made

---

MEDICINE 100 YEARS AGO

Extracts from a leading article on the regulations of the Royal College of Surgeons relating to admission to the college diploma; from the *Provincial Medical Journal* of Dec. 17, 1842:

" In October, 1841, the college published certain regulations, respecting the professional education of candidates for their diploma. Under these regulations a very respectable course of education was prescribed, including, amongst other improvements, attendance on the practice of surgery at some recognized hospital during a period of three years; and attendance on the practice of medicine during a period of one year. It was also announced by the council ' that after October 1, 1842, candidates would *only* be admitted to examination under the regulations alluded to, except under peculiar circumstances of apparent hardship.' The amended regulations of October, 1841, were promulgated under the authority of the council of the College of Surgeons, and students had prepared themselves for the more costly and extensive acquirements expected from them, when, in the course of the present year, a rumour got abroad that the college was privately admitting great numbers of practitioners, without any regard to their own regulations—without requiring from them the same proofs of professional education, which less favored individuals were compelled to furnish. . . . On the 18th of November last the college sent forth the following extraordinary document:—

" ' ROYAL COLLEGE OF SURGEONS OF LONDON

" ' The Court of Examiners having found that erroneous statements have lately been published respecting the mode in which gentlemen engaged in the practice of surgery may obtain the diploma of the college, and that other candidates for the diploma have experienced difficulty and inconvenience from inattention to the regulations, by which the required course of study has been, from time to time, augmented, or from inability to comply with those regulations, have resolved: That gentlemen who were practising surgery prior to 1835, be admitted to examination on producing proofs of such anatomical and surgical education as may be deemed sufficient by the Court of Examiners. That other candidates be admitted to examination upon the production of the several certificates required by the regulations in force when they began their professional education by apprenticeship, or by attendance on lectures or hospital practice.

" ' EDMUND BELFOUR, Sec.

" ' November 18, 1842.'

" Though unwilling, at any time, to attribute other than honorable motives to respectable men, we must say that the preceding resolutions of the college require explanation. The motive alleged in the preamble, if we may so call it, is illusory, and a contemptible blind to deceive the profession. If ' erroneous statements had lately been published,' why not correct them in the usual manner? The periodical press is ever ready to assist the college in the correction of error and the dissemination of truth. But the statements were not erroneous. The error—the deceit—lay with the college; and it is little less than a barefaced subterfuge to make the correction of an error, which was of their own making, the pretence for issuing regulations totally unworthy of the college, and at variance with the spirit of the age."

BRITISH MEDICAL JOURNAL

LONDON SATURDAY DECEMBER 26 1942

THE SCIENCE OF HEALTH*

BY

JOHN A. RYLE, M.D.

Regius Professor of Physic in the University of Cambridge; Consulting Physician to Guy's Hospital

For my annual wartime lecture I have chosen on this occasion a subject which, curious though it may seem, finds no special place or mention in the curriculum. Medicine is primarily concerned with the observational study (with a view to its relief) of disease at the bedside, in the consulting-room or clinic, and in the laboratory. Disease also has its own science of Pathology, which is concerned with the more intimate laboratory investigation of its causes, processes, and consequences. But, notwithstanding that the study of health would seem to be the proper preliminary to the study of disease, we find no counterpart to medicine, no parallel observational science devoted to the fireside or field-side or laboratory study of health. Nor is there a science comparable to pathology which deals with the more intimate causes, processes, and consequences of health.

Hygeia, the daughter of Aesculapius, was the goddess of health, a subject in which the Greeks were intensely interested, and hygiene originally meant the science of health; in modern usage, however, it has come to convey the narrower meaning of sanitary science. Physiology and anatomy, it is true, concern themselves with some of the processes and attributes and supply some of the standards of health; but as a rule they have little to say of its outward manifestations, of what may even be called its "symptoms and signs," or of that elaborate co-ordination of functions by which it is constituted. They touch scarcely at all upon its causes and consequences.

Please do not think that I wish to extend or complicate the curriculum, but it is surely an omission that so little attention has been paid by the students of disease and their teachers to that state from which some deviation or departure must occur before the existence of disease is recognized. And so, because it has a bearing on your future tasks and outlook, I suggest that we give our minds to the subject of health and how it might be better regarded and how more usefully observed and studied. Let us begin by asking ourselves five questions: (1) What is health? ; (2) Why is it important to know more about health? ; (3) What are the principal symptoms and signs or other criteria of health? ; (4) What are the causes and consequences of health? ; and (5) How in the future can we make a better contribution to the promotion and maintenance of health?

What is Health?

There are difficulties in the matter of health as a concept. It is not at all an easy thing—less easy even than disease—to define, and most existing definitions are inadequate. My *Oxford English Dictionary* defines it as "soundness of body," my medical dictionary as "a normal condition of body and mind." The first of these is clearly insufficient. The second leaves us with the old indecision as to what we mean by normal. It is possible for a man to pass every physical and chemical test known to medicine and yet to be a very sick man—to suffer, for instance, from severe recurring bodily discomfort or continuing mental anguish. On the other hand, he may be left by disease or injury with gross physical defects, including loss of limbs, and nevertheless be abounding in vigour and surpass in efficiency and happy achievement the majority of his unscathed contemporaries. We must also allow that the criteria of health vary with age, sex, occupation, and race.

A good definition of health in the individual should convey the idea of competence to perform and enjoy the tasks and functions appropriate to his or her age and sex. It should convey the idea of well-coordinated function, of life vigorous, well balanced, and attuned to its environment. It should certainly mean something more than a state of "no disease." In the training camps for the Army there are at present gathered together many young men who have been passed as fit for military service. After a few months of training they are already an entirely altered set of men in appearance and bearing and physical efficiency and mental outlook, and they not infrequently gain half a stone or more in weight in that period. In addition thousands of men accepted for service are later found unfit to go through with their training. All these were medically examined and labelled as fit for a virile profession, but they were obviously a long way from the optimum or possible vigour and development due to their manhood and original physical endowments. They had not really achieved health.

If we go back to the *O.E.D.* and look up, not its definition but an earlier alternative for the adjective "healthy," we come, I believe, a little nearer to what we are seeking. The old adjective for healthy is "hale." From "hale" the word "whole" is also derived. "Hale," we are told, means "free from infirmity; sound; vigorous"; but "whole" has also come to convey the idea of completeness. By "the whole man" we can understand not merely the "total man" in a structural regard but man in the fullness of his functional development and integrity—that is to say, in a physiological and a psychological regard. The B.M.A. Medical Planning Commission has recently coined a much-disputed phrase—"positive health"—implying thereby something better than "no disease." It does not bear close analysis, and, if we accept the idea of health as wholeness—implying fulfilment or completeness and co-ordination of function—the prefix "positive" becomes unnecessary.

We are not, however, to infer that there is only one pattern of health or wholeness; for we know that the human species, like other domesticated species, shows a wide range of variability. Health manifestations, like disease manifestations, can vary from individual to individual. But we may insist that for each main type or variation due to race, parentage, age, and sex there can be laid down certain criteria over and above the mere absence of detectable disease which stand for wholeness or health. These criteria have still to be more precisely determined and described, for reasons which we must shortly discuss. Their description and measurement are among the tasks of the science of health.

Why is it Important to Know More about Health?

This question may be considered from the point of view of the student of medicine, the individual citizen, and the community. Unless the student of medicine (be he qualified or unqualified) has a good working knowledge of health and health standards and manifestations, of the nature or physiology of what I shall describe as the "symptoms" of health and of its surface markings, he is not in a position to detect or investigate the early deviations from it. Unless, furthermore, he appreciates that most of the symptoms of disease can be explained physiologically as exaggerations or depressions of the ordinary symptoms of health he will fail to appreciate those natural gradations between healthy and morbid function which are constantly discoverable in practice, and he will tend to think vaguely in terms of "normal" and "abnormal" as though there were a sharp division between the phenomena of health and the phenomena of disease.

---

* An undelivered lecture prepared for the students of the Medical Faculty, University of Cambridge.

Dyspnoea in response to vigorous exercise is a symptom of health. Dyspnoea at rest or with trivial exertion is a symptom of disease. Flushing in a hot atmosphere is a symptom of health. It is also a symptom of fever when the internal, as opposed to the external, environment is modified by disease. Appetite is a symptom of health; poor appetite and loss of appetite are among the most significant symptoms of disease.

There is, however, quite another reason why the student of medicine should wish to know more about health. It is linked with a present and important reorientation of our professional thought. It is becoming steadily more apparent that in the future the emphasis of medicine will be increasingly upon its preventive and protective aspects, upon the social as distinct from, but supplementary to, the individual applications of accumulating knowledge. Instead of waiting to cure—or to try to cure—the individual of preventable disorders and diseases we shall endeavour to see that conditions are such that fewer and fewer individuals develop them; and, not content with those states of body and mind which can only be called "no disease," we shall encourage by every method within our power the preservation of health and the elevation, in the minds of doctors and laity alike, of the idea and the standards of health. Apart from the hundreds of thousands of people in these islands who suffer from active and diagnosable disease and are either bed-ridden or in other degrees incapacitated from full and useful citizenship, there are millions, like the recruits to whom I have referred, who might by our present rough standards be placed in category A, but who could not—while lacking signs of evident disease—be considered as really healthy or whole. Although unalterable ancestry would commonly be found to have provided initial handicaps, environmental factors (in many cases alterable), operating on body or mind, or both, would be found to have the more widespread adverse influence.

The better and earlier assessment of the lesser degrees of what we have come to call "ill-health" (really a contradiction in terms) in individuals and the community is becoming an urgent duty. The study and recognition of the causes of disease and debility, and of those states which have no name and often evoke no open complaint but which fall just short of health, have led us back at last to the recognition and the need for the better discrimination of the causes of health itself. To some of these I must shortly refer, but they are nowhere better illustrated than in the field of nutrition.

If you want illustrations of what I have in mind you have only to keep your eyes open in buses, tubes, and trains and to ask yourselves what proportion of your fellow travellers, even on a superficial and untrained inspection, would be likely to prove really healthy or whole. In mining and industrial districts and slum areas you would find the levels of fitness more conspicuously on the debit side; for here you would see at all ages a far greater proportion of stunted bodies, pale faces, and bad teeth. Here, too, on a basis of the same crowding and poverty, tuberculosis, rheumatic fever, and diphtheria find the opportunity which they are ceasing to find in kindlier social climates. Briefly we may say—and none could dispute us—that health or wholeness is far too rare, that the standards of health which we have allowed to pass are far too low, and that many of the causes of this state of affairs are now apparent and are to be found in defects of environment, of education (both mental and physical), and of rest, recreation, ventilation, and nutrition. As the doctors of the future you must begin to think how this situation can be remedied. By demonstration of what can, in fact, be quickly achieved, as through the provision of better conditions for two sections of the community only—the elementary-school child in peacetime and the recruit in wartime—the people as a whole must eventually be persuaded of the possibility of the real health that is their due. What they ought to possess and its importance in a national regard have long been recognized, as witness the old adage, *Salus populi suprema est lex,* or Disraeli's insistence that "the health of the people is really the foundation upon which their happiness and all their powers as a State depend."

The health of the people has been greatly served, let us admit, by a number of epoch-making discoveries, by numerous public health measures, by political and economic changes and (except in the matter of war-proneness) by the general upward trend of our civilization. Curative medicine and surgery have also played no inconsiderable part. In future the preservation and wider distribution of health in the community, based upon a better understanding of its causes and not only on a knowledge of the causes of disease, will make contributions as remarkable as any of these.

But if we are to control health we must know how to diagnose it and we must further elucidate its causes. It is by such means that we have learned to control disease. Pathology has provided the basis of much physiology. Similarly clinical study can point the way to the study of health, for clinical training provides the right methods and encourages the right aptitudes, although it has not always led as promptly as it might have done to the right inferences and actions.

The Symptoms and Signs of Health

We all know vaguely what we mean when we say that we "feel fit." The top-of-the-world feeling at the height of a good holiday; the keen appetite and good digestion and regularly acting bowel; the pleasing muscular aptitudes; the tingle of bare skin in sun or wind and its free response to changes of temperature and to exertion; the pleasant sense of muscular fatigue at the day's end (so different from city weariness); the even temper; the gay spirit and the ready laughter—all these are symptoms of health. In youth many of them are experienced apart from holidays. The older we become and the more occupied with affairs and cares and sedentary occupations, the less fully aware are we of all these pleasant sensory phenomena and the more surely does it require a long holiday in good surroundings to recall them. As the mode of our lives becomes less wholesome we become, indeed, less whole. We may well wonder whether the working men or women in the poor streets of our crowded cities, whose holidays seldom if ever run to a week and whose incomes rarely allow of rest and refreshment in the country or at the seaside, have ever enjoyed what most of us here have enjoyed of true health or wholeness.

Now, just as loss of appetite, irregular bowels, undue fatigue, poor sleep, greasy or dry skins, ruffled tempers, and low spirits—not to mention more definite aches and pains or depression, dyspnoea, or dizziness—have their diagnostic significance and physiological interpretation, so too have the subjective phenomena of health their diagnostic significance and physiological interpretation. Their more intimate meanings have not in most instances been fully worked out as yet, for bodily and mental sensitivities are still more delicate than our chemical and physical tests. Professor Adrian has not tapped or taped them all with his electro-encephalogram, or taught us how to amplify them with his loud-speaker for purposes of demonstration or analysis. But this does not mean that they cannot in the meantime be usefully studied by observational and descriptive methods and elucidated by inference and comparison; or that their causes cannot be sought as physicians have long sought, by patient watching and record, the causes of their counterparts—the symptoms of disease. Their study is naturally helped by parallel observations on the objective manifestations or "signs" of health. The fresh colour and fine texture of the skin, the crispness and lustre of the hair, the good teeth, the sweet breath, the upright and graceful carriage, the firm limbs, the easy breathing, the frank manner, the free movements on the track or the tennis court or in the swimming-pool—all these are among the eloquent signs of health in youth. In the child we see the softer skin and other sprightliness of movement, other gaieties, the skipping progress of the small girl home-coming from school; in the infant the firm roll of fat at the wrist, the contentment, the absence of crying (except under the compulsion of hunger or a passing pain), the earnest attempts at crawling, standing, or walking, the lovely postures of sleep; and in the old—even though movements now be slow and memory less quick and laughter a less boisterous affair—we sometimes witness the silver locks and rosy porcelain skins and a serenity of mind which are the true manifestations of health in age.

And when as physicians we have occasion to make our routine examinations at these various ages we learn that there are behaviours in respect of body-weight and build and growth and sleep and bowel and bladder function, of menstruation, of pulse rate and blood pressure and haemoglobin percentage, which are appropriate and natural and may be counted among the measurable criteria of health. Or we may detect departures from them which give us pause or, may be, lead our inquiries to the discovery of incipient or established disease.

Why should you not begin your training in the observation of these things now? Why should you not seek for physiological explanations of the familiar symptoms and signs consistent with well-being or its borderland states, that you may the better recognize those of more patent disorder or disease when they begin to come your way? Appetite, hunger, satiety, laughter, blushing, hiccups, yawning, sneezing—here are familiar symptoms ready to hand and inviting your inquiry. I suggest that you try and write a full description of any one of them to-morrow. I should like one day to see some good cinematographic illustrations of man's strange convulsive phenomena—of laughter, sneezing, and hiccups—and to study them in slow motion. The better you can describe and explain these events, the better, later on, will you describe and understand fits and flatulence, nausea, vomiting, and vertigo when you take up your work in the clinic. There, although it is common—too common—to account as "interesting cases" only those of the more rare or advanced diseases, it should really be our first pride and purpose—remembering the features and phenomena of health—to detect the earliest departures from it, to recognize morbid conditions when they are more susceptible of arrest or cure, to be more familiar with those multitudinous shades and varieties of unfitness which might have been altogether avoided. For the physician with a naturalist's eye, moreover, the study of all these phenomena of life, whether healthy or morbid, can come to have a fascination of its own, and quite apart from special uses.

The Causes and Consequences of Health

The causes of health, like those of disease, are to be found in ancestry and environment. In nature (which we will assume to mean in all wild species living under conditions unmodified by man) the survival of the more robust and adaptable breeds and individuals, together with natural activity, results in the maintenance of a high and even curve of health. The unfit do not long survive, and, whether in a nest of ants, a flight of swallows, a school of porpoises, or a herd of deer, it is unlikely that the most skilled clinical survey would reveal anything like the variability in body-form, weight, colouring, vigour, and other criteria that such a survey would reveal, shall we say, in domesticated cattle or a native tribe. In a so-called civilized community the variability is far greater, and deviations from the mean in respect of stature, colouring, and health, and even the unlovely features of declared disease, are all more frequent and more apparent. Variation under domestication was, as you know, one of Darwin's special studies. Man has constantly increased his variability as well as that of his domestic animals. His animals he has bred for new types, for quality, and for quantity. By his own modes of living and social organization, however, he has produced many deviations from health, and by his self-protective measures he has made it possible for the unfit to survive in large numbers, whether their unfitness has been due to genetic or environmental factors, or to both. He has both bred morbidity and preserved it. And now he is seeking the answers to his mismanagement.

Students of eugenics (which has been defined as "the study of agencies under social control that may improve or impair the racial qualities of future generations either physically or mentally") formerly applied themselves especially to those hereditary influences which are accounted inimical or favourable to man. To-day they are more alive to the importance of environmental influences and to the fact that these are also more controllable. Medicine and preventive medicine and other forms of social service, together with physical training and education, are among the agencies whereby we have sought to keep individuals and communities in health. It is clear that we cannot at present influence national health to any great extent by applications of genetics. We cannot adopt the methods of the stock-breeder with his flocks and herds. Such is our respect for the liberty of the individual—and, I might add, our disrespect for the race—that we cannot yet control, by segregation or sterilization, the excessive fertility of village half-wits who perpetuate their kind with multiple illegitimate births. We cannot at present even do much towards encouraging the general fertility of the fit and discouraging the general fertility of the unfit. Economic and other insecurities have tended to the serious artificial limitation of families on the part of those most worthy to rear them.

There are, however, a number of things that could be done to ensure and assist the health of the people by modification of their actions and habits, their nutrition, and their environment. Better food, better education in the purchase and preparation of foods, better general and technical and sex education, better wages, better housing, social insurance, holidays with pay, opportunities for games and recreation, the provision of every advantage which infantile and child health and growth require—these are possible things. These are themselves among the more important causes of health. And in the schools and the universities, in the Services and the training camps there should be ample opportunities for the more intimate study and measurement and cultivation of health, and for physiological experiments in health regulation and control. The study of growth in childhood and adolescence and of the relative influences here of nature and nurture awaits a full inquiry.

You will rightly comment that the social reorganization needed to provide the adequate causes of health is not within the immediate province of science or the doctor. It is not my purpose here to go outside that province except to remind you that it is upon the wise application of science to human problems that some of our greatest human and social advances have been and must in future be based. The more carefully you use your eyes and other sense-organs, the more accurately you collect and correct your data, the more factual arguments you can assemble to show that health or wholeness is something better than "no disease," that its symptoms and signs and measurements are this and that and its causes or antagonists such and such, the more incumbent will it be upon peoples and their Governments to ensure that the lessons of your science are eventually and effectively applied. They took the advice of doctors about infectious disease as it were but yesterday. To-morrow they will take it about nutrition and housing and working hours, and that degree of security of prospect without which it is impossible to maintain full sanity of mind and soundness of body.

Of the consequences of health need we say more than that it paves the way for happiness and performance and makes for more effective individual and national life and labour, and so helps production and prosperity and provides, in fact, a nation's best economy? How much fitter our recruits would have been, how much less striking the contrast in stature between many of our home troops and their cousins from overseas, and by how much our war output might have been increased in these war years, if we had attended to health as assiduously as we have attended to wealth in the pre-war years! And what a nation we could become again if we would but accept and act upon the fundamental principle that, for the individual and the community, health of body and mind and the things that secure them are the most important of all economies and the surest shield against adversity and discontent and conflict! To quote Disraeli once again, "The health of the people is really the foundation upon which their happiness and all their powers as a State depend."

The Future

If the human world can be saved from its most immediate enemies and dangers, the future, or an important part of it, will be in your hands. To its better building you must direct your science and your humanism, and you must see that these two forces work in the closest partnership. The word "doctor" means "a teacher," although in this country it has also come to have the more special meaning of "healer." One of the functions of doctors is to contribute of their knowledge and experience to the development of a healthier and happier state and to the education not only of the people but of the people's leaders. I would urge that your science and your humanism must come to serve the State in fuller measure than the science and humanism of the older generations have done.

Will you accept, therefore, that you are going out into the world in a few years' time not only to cure and palliate disease but—true to your title of doctors—to teach health and the causes of health and the necessary provisions for health, remembering always that this teaching must first find a firm basis in the science of health? Towards all this your present studies provide an important introductory discipline—but only a partial one, for the emphasis of teaching is often in the wrong place, and the co-ordination of your many subjects is not yet what it might be. In much the same way it may be urged that our existing medical services often apply the emphasis in the wrong place and lack the co-ordination we would one day like to give to them. And so will you in your generation also help us in ours to bring health or wholeness to our educational systems and to those collaborations of social and individual medicine with which it will one day be your privilege and responsibility to serve the people of this and other countries?

Last of all, for I have not yet mentioned your very proper duty to yourselves, remember that the doctor who has poor opportunities or a scant regard for his personal health—which above all other blessings should bring balance to his life and judgment to his work—can scarcely become the most respected and effective teacher.

TREATMENT OF SUPERFICIAL TUBERCULOUS LESIONS BY LOCAL APPLICATION OF PROMIN*

BY

W. H. TYTLER, M.B.Toronto
David Davies Professor of Tuberculosis in the Welsh National School of Medicine

AND

A. D. LAPP, M.D., D.P.H.Toronto
Senior Resident Medical Officer, Glan Ely Tuberculosis Hospital, Cardiff

(From the Welsh National Memorial Association)

The results obtained by Feldman, Hinshaw, and Moses (1940, 1941, 1942) in the treatment of experimental tuberculosis in guinea-pigs by promin (sodium salt of *p,p'*-diaminodiphenylsulphone - N , N'- di - [dextrose sulphonate]) have aroused great interest both in America and in this country. Not only did the drug, given daily by mouth, prevent or limit the development of disease, in animals inoculated with a virulent bacillary strain, when treatment was begun on the day of infection, but even when it was delayed for six weeks thereafter the effect was pronounced, and in some animals no tuberculous lesions were found at necropsy 192 days after inoculation. Feldman, Mann, and Hinshaw (1942) have now repeated the experiments, but have proved by biopsy the presence of microscopic tuberculous lesions in the livers of the animals when treatment was started, six weeks after infection; and again several treated animals showed no lesions at necropsy, at 224 days. While some factors involved in these results require further discussion, they appear to be the most impressive yet reported in the chemotherapy of tuberculosis in the guinea-pig.

The guinea-pig tolerates a daily dosage, by mouth, of 300 to 400 mg. over long periods. In man, unfortunately, much lower dosage relative to weight may soon produce toxic effects, particularly haemolytic anaemia. Trial treatment of pulmonary tuberculosis has been fairly extensive, though published results are yet scanty. But, from wide informal discussion, it appears that outstanding success has not been attained with any dosage which is well tolerated.

One of us (W. H. T.) has had in hand for some seven months a guinea-pig experiment similar to those of Feldman, Hinshaw, and Moses, with comparable results, so far as they are yet apparent. The very evident effect of the drug in this experiment suggested that it might be exploited in the treatment of accessible non-pulmonary lesions, to which effective concentrations might be applied locally without producing a toxic blood level. After treatment of this type had begun, we learned that in America promin has been applied locally by spray or inhalation in some cases of laryngeal or tracheo-bronchial tuberculosis, with good results. More recently we have heard, by personal communication, that Dr. G. T. Allerton of Torquay has been applying the drug to superficial lesions with much success.

Method

The high solubility and rapid absorption of promin indicated that the maintenance of an effective concentration in the lesion might require frequent application of strong solutions unless the drug were incorporated in a medium which would limit diffusion. The medium first tried was tragacanth, which at relatively low concentrations gives a stiff insoluble jelly; and this medium has proved so satisfactory that no extensive trial has been made of others. One preparation of promin and tragacanth in glycerin was made, in the hope that the gum, by absorbing water in the lesion, might produce a stiffer gel than could be injected, but the preparation in itself proved difficult to handle and to inject. The use of tragacanth, however, makes sterilization difficult. Promin in 40% solution may be autoclaved at 120° C., and if cooled slowly remains in solution, particularly if 5% glucose has been added. If the solution is cooled rapidly, or with weaker solutions in any case, precipitation occurs, though solutions of 1% or less only become hazy. But, owing to the insoluble nature of the tragacanth gel, and to the stiffness required, it is not practicable to sterilize the gel separately and then add the necessary promin in sterile form. For the lesions so far treated, therefore, we have not attempted sterilization, but have relied on the bacteriostatic effect of the drug, which is considerable at the strength used. For injection into closed serous or similar cavities, however, it would be desirable to develop some method of sterilization which would exclude the presence of viable spores, particularly those of *Cl. tetani.*

In the preparation of a smooth jelly the most important step is the rapid dispersion of the tragacanth powder throughout the aqueous solution, before swelling and lump formation occur. The promin solution, in a beaker, is stirred mechanically by a rapidly rotating propeller blade, and the tragacanth is dusted in directly over the blade. The jelly is then smoothed out by sucking in and expelling through the bare nozzle of a large syringe, and finally by expelling through an attached needle (18 S.W.G.). Two different batches of tragacanth have given satisfactory gels at 3.5% and 3.0% respectively, the stiffness being such that considerable pressure is required to force it through the needle. In use the jelly is either sucked into the syringe through the bare nozzle, or may be filled into the open barrel, and injected either through the needle or, for sinuses, through a fine catheter tied to the nozzle. The first jelly contained 5% promin, which caused no irritation, and was increased to 10% and then 20%. The latter caused increase of exudation, and though the end-results were good we have now gone back to 5% as giving equally satisfactory results.

At the time of writing 10 cases have been treated in Glan Ely Hospital, Cardiff, of which notes are given below. So far, only such lesions have been selected as were easily accessible either to aspiration and injection or to instillation into open sinuses.

Case Notes: Closed Abscesses

Case 1.—Man aged 25. June 13, 1942: Admitted Glan Ely Hospital. Pulmonary tuberculosis, caries dorsal spine. Abscess pointing in lumbar region; 170 c.cm. pus aspirated; 5 c.cm.

---

* The drug has been developed by Messrs. Parke, Davis and Co. Ltd. in America, where the name "promin" was given to it; but in this country, owing to difficulties in registration, it will be known as "promanide." It will, however, be referred to in the article as "promin."

promin (5%) in glycerin injected. Repeated nine times to July 17; about 40 c.cm. pus each time. Aug. 4: 140 c.cm. pus aspirated; 5 c.cm. P. jelly (10%) injected. Sept. 18: 42 c.cm. pus aspirated; 8 c.cm. P. jelly (20%) injected. No further aspiration necessary. *Laboratory Report.*—May 12, 1942: Pus; acid-fast bacilli found after concentration. Culture yields growth of human type T.B. No other organisms in film or blood-plate culture.

Case 2.—Man aged 37. June, 1941: Admitted Glan Ely Hospital. Advanced pulmonary tuberculosis. Fair progress to June, 1942, when red swelling appeared in midline above sternum, and another in right axilla, both fluctuant. June 23: Neck abscess; 4 c.cm. pus aspirated; 2 c.cm. P. jelly (5%) injected. June 25: Repeated. June 28: Abscess broke down, and healed completely in a few days. July 2: Axillary abscess; 14 c.cm. pus aspirated; 4 c.cm. P. jelly (5%) injected. July 6: 22 c.cm. pus; 4 c.cm. P. jelly (5%) injected. Abscess did not refill. Sept.: Abscess formed over middle of sternum. Aspirated three times at three-day intervals; each time 3 c.cm. pus: 2 c.cm. P. jelly (10%) injected. A few days later the abscess broke down, and then healed rapidly. Nov.: General condition improved; no further abscesses. *Laboratory Report.*—June 23, 1942: Pus; acid-fast bacilli in film. Culture yields growth of human type T.B. No other organisms in film or blood-plate culture.

Case 3.—Man aged 33. Sept., 1941: Pain in back. April, 1942: Dorsal swelling; pus aspirated in hospital. July 7: Admitted Glan Ely Hospital. Radiograph showed caries D.V. 12 and L.V. 1. Large abscess lower dorsal region; aspirated. July 20: 3 c.cm. P. jelly (5%) injected. July 23: 3 c.cm. (5%). Aug. 26: 14 c.cm. (20%). Aug. 30: 9 c.cm. (10%). Sept. 3: 8 c.cm. (10%). Sept. 8: 5 c.cm. (10%). Sept. 18: 5 c.cm. (10%). Nov.: Abscess remains flat since last treatment.

Case 4.—Man aged 34. 1931: Tuberculous left testicle removed. Discharging sinus from right testicle for four or five years. Dec., 1938: Pain in back. Aug., 1939: Radiograph showed caries D.V. 11. Sent home on plaster bed. July 2, 1942: Readmitted Glan Ely Hospital for observation. Nervous disturbance, diagnosed functional. Aug.: Up. Sept. 5: Abscess lumbar region; aspirated, no pus obtained; 2 c.cm. P. jelly (20%) injected. Sept. 11: Fluctuant, 4 c.cm. thick pus aspirated; 3 c.cm. P. jelly (20%) injected; abscess gradually became non-fluctuant. Nov.: Only small hard area remains. *Laboratory Report.*—Aug. 11, 1942: Urine—pus, but no acid-fast bacilli in film. Culture yields growth of human type T.B.

Case 5.—Man aged 41. June 11, 1942: Admitted Glan Ely Hospital. Suspected tuberculous spine. Diagnosed probable new growth, belied by steady clinical improvement. Oct. 16: Abscess lumbar region; 35 c.cm. creamy pus aspirated; 5 c.cm. P. jelly (5%) injected. Abscess disappeared fairly rapidly. No further aspiration necessary or possible. *Laboratory Report.*—Oct. 16, 1942: Pus; no acid-fast bacilli after concentration. Culture for T.B. negative so far (21 days). Film shows cocci. Blood-plate culture gives pure growth *Staph. aureus.*

Open Sinuses

Case 6.—Man aged 31. Nov., 1940: Injury to back; pain ever since. July, 1941: Lumbar abscess. Nov. 15: Admitted Glan Ely Hospital. Caries lumbar spine, sinus lumbar region, persistent to July, 1942. July 7: 1 c.cm. P. jelly (5%) instilled by catheter; continued daily to Sept. 1, when sinus was too small to retain jelly. Nov.: Still a superficial remnant; small discharge. *Laboratory Report.*—July 11, 1941: Pus; acid-fast bacilli in film. Culture yields growth of human type T.B. No other organisms in film or blood-plate culture.

Case 7.—Man aged 28. Jan., 1941: Abdominal pain; fever. Feb. 28: Laparotomy; tuberculous peritonitis. Aug. 10: Persistent sinus in laparotomy wound, no progress. Feb. 2, 1942: Admitted Glan Ely Hospital. Faecal fistula, which closed but left persistent sinus. July 17: No fistula; sinus remains, 1 c.cm. P. jelly (5%) instilled by catheter daily to Sept. 1, when sinus was dry. Nov.: Healed scar, firm and healthy.

Case 8.—Man aged 31. June, 1941: Swelling left loin. July: Opened in hospital. Nov.: Radiograph showed caries of lumbar spine. Feb. 19, 1942: Admitted Glan Ely Hospital. Sinus discharging thick foul pus, continuing to July. July 17: 5 c.cm. P. (5%) in glycerin instilled to bottom of sinus; continued daily. P. jelly (20%) used for three weeks, continued to present; now using 5%. Discharge at first increased and thinner; later decreased. Nov., 1942: Sinus still open, but much shallower, with little discharge. *Laboratory Report.*—July, 1941: History states pus reported sterile.

Case 9.—Man aged 22. Treated in Glan Ely Hospital, Oct. 15, 1936, to July 7, 1937, for caries of lumbar spine. Discharged quiescent. Worked to Jan., 1942, when he fell and injured back. May 25: Readmitted Glan Ely Hospital; abscess pointing in right groin; repeated aspirations. Aug.: Sinus formed. Aug. 30: 5 c.cm. P. jelly (5%) instilled to bottom of sinus; since then, 3 or 4 c.cm. 20% every four days. Nov.: Sinus very shallow; no pus. Treatment continues. *Laboratory Report.*—May 28, 1942: Pus; acid-fast bacilli after concentration. Culture yields growth of human type T.B. Film shows some Gram-negative bacilli, but blood-plate culture sterile.

Case 10.—Man aged 23. April, 1941: Doubtful history of pain in back. Nov.: Swelling left groin, opened in hospital. May 21, 1942: Admitted Glan Ely Hospital; discharging sinus; radiograph showed caries L.V. 4 and 5. Sept. 8: Abscess pointing over right ilium; aspirated every three or four days, and 5 c.cm. P. jelly (20%) injected. Sept. 29: Abscess broke down; catheter passed into sinus 16 in. deep; 5 c.cm. P. jelly (5%) instilled to bottom, continued daily to present. Nov.: Discharge less, and thinner. Sinus about 6 in. deep. The first injections into closed abscess did not reach beyond superficial part of the large cavity.

Three other cases of cervical adenitis with abscess formation were treated, but as the lesions were opened and scraped shortly afterwards the results are without significance.

Discussion

With the exception of Case 5 all the lesions treated were considered on clinical grounds as undoubtedly tuberculous. In 4 cases tubercle bacilli were demonstrated by film and culture, and in a further case, No. 4, in culture from the urine. All cultures were human type. In the two closed abscesses, and in one of the two sinuses, in which tubercle bacilli were demonstrated, there was no secondary infection at the time of examination. In the other sinus Gram-negative bacilli were seen in film but did not grow in culture.

While the results were somewhat irregular the clinical opinion is that the improvement in all was greater or more rapid than would have been expected by orthodox methods applicable. In Case 2 the results were spectacular, in that three different abscesses each healed completely within two weeks of starting treatment, leaving only small fibrous residues.

In two cases, each on one occasion, there was a rise of temperature on the day after treatment, probably depending on disturbance of large abscesses. Apart from these isolated events nothing that could be interpreted as a toxic effect was seen.

It is thought that these results justify a more extensive trial of the drug by local application to suitable lesions, and possibly to more deep-seated lesions which can be injected. At present we are turning our attention particularly to cervical glands in which softening has occurred. These lesions can be treated by injection in the dispensaries, and it is hoped in this way to obviate the need for operative measures, often involving a long wait for admission to hospital, with prejudice to the patient and the occupation of valuable bed-space when admitted.

We wish to express our gratitude to the manufacturers for liberal supplies of the drug, and to their medical representative, Dr. J. Stanley White, for much assistance and information. We also acknowledge gratefully our obligation to Dr. A. Brownlee, medical superintendent of Glan Ely Hospital, for permission to carry out the investigation in that hospital.

Those who claim that they derive valuable information about the heart from the quality of its sounds may find some graphic support in the vibrocardiograms of Kountz and Smith (*Southern med. J.*, 1942, **35**, 713). Using a special microphone actuating a cathode ray, they record all sound vibrations between 1 and 500 cycles per second generated by the heart. Certain features of the graph so produced appear to change in quality in patients with "myocardial disease." It is impossible to evaluate the results because clinical details are entirely lacking. However, the method deserves attention, for the quality of the heart sounds and its relation to disease is still a vexed question, and if it can be settled by graphic means it will be helpful.

TUBERCULOSIS DEATHS AND THE WAR

BY

PERCY STOCKS, M.D., D.P.H.

Medical Statistical Officer, General Register Office

Tuberculosis mortality has been described as a social barometer, and this it is in more than one sense. The actively tuberculous population, numbering somewhere about a quarter of a million persons, is very sensitive to environmental changes such as periods of unusually cold weather, industrial depression, increased crowding due to various causes, shortage of certain foods, enhanced stress of living conditions produced by war, and even, it seems likely, to psychological stresses affecting large bodies of people. The immediate effects of cold winters and influenza epidemics, for example, are reflected in the deaths from respiratory tuberculosis occurring in the March quarters, which are given below for England and Wales in the period 1924-38:

1924	**9,690**	1929	**10,140**	1934	7,429
1925	9,126	1930	8,227	1935	6,947
1926	8,517	1931	**9,018**	1936	6,892
1927	**9,240**	1932	8,244	1937	**7,147**
1928	8,444	1933	**8,912**	1938	6,004

The bold figures indicate levels higher than in either the preceding or succeeding year, and, of the six quarters in which they occurred, those of 1924, 1929, and 1931 were unusually cold, while those of 1927, 1929, 1933, and 1937 had rather severe influenza epidemics. The tuberculous have not the normal reserves of strength to meet additional stresses and strains, and they react very quickly by a rise in death rate. If the increase in deaths is considerable or if it is long continued and not accompanied by a corresponding rise in incidence of new cases, the reservoir of persons in an advanced stage of the disease may be thereby so much reduced in numbers that a rapid fall in deaths at once follows when the stresses are removed. This probably accounts for the rise and fall in deaths from respiratory tuberculosis noticed at the beginning of wars, though it does not account for the increase in deaths from tuberculous meningitis which also appeared early in the present war.

In another sense tuberculosis deaths are an index of social conditions because if changes in the latter are such as to increase the incidence of active disease this is inevitably followed by a rise in death rates, and in so far as the new infections are of the meninges and nervous system this increase becomes quickly evident. In the case of new respiratory disease, however, the effect on deaths may be so long delayed as to appear as a secondary wave after the initial wave referred to above has almost passed. In the present war, so far, we have experienced the initial wave due to hastened deaths of the already tuberculous, and, starting rather later, a wave due to fresh meningitic infections. It will be seen below that each of these waves reached a peak in 1941 and that a rapid fall towards the normal has since been registered in the first half of 1942; but a resumption of harder conditions may yet produce further temporary increases of the same kind. Furthermore, the reservoir of tuberculous persons is probably greater now than at the onset of the war owing to increased incidence of active disease in 1940 and 1941, and if that is so a return to the normal peacetime trend of deaths is likely to be delayed.

For a long period preceding 1939 we had become accustomed to a continuous decline in tuberculosis deaths, and it is necessary to bear this in mind when estimating the effects of the war. When deaths have merely returned to the 1938 level this will not mean that the debt has been paid, because had there been no war there is no reason why the steady decline should not have progressed, bringing 1942 deaths much below the 1938 level. In order to obtain a proper base level of peacetime expectation it is reasonable to assume that the rate o proportional annual decline experienced during the pre-wa period would have continued year by year. The figures belo designated as "expected" are based on that assumption, bu they are necessarily only approximate owing to the impossibilit of taking into account at this stage any changes in the popula tion at risk which may have been occasioned by the war. I must suffice to say that the deaths here recorded comprise al deaths in England and Wales, whether of civilians or of non civilians.

Respiratory Tuberculosis

The average numbers of deaths from respiratory tuberculosis classified according to the method of assignment in use up t 1939 and occurring in the first and second halves of the year in triennial periods from 1924–6 to 1936–8 were as follows:

Period	First Half of Year		Second Half of Year	
	Average Deaths Occurring	Fall from Previous Period (%)	Average Deaths Occurring	Fall from Previous Period (%)
1924–6	17,299		14,458	
1927–9	17,102	− 1 1	13.662	− 5·5
1930–2	15,866	− 7 2	13,041	− 4·5
1933–5	14,357	− 9 5	11,690	−10 4
1936–8	12,578	−12·4	10,618	− 9·2

Between 1931 and 1939 the population was increasing by abou 1.5% every 3 years, so, adding this to the average percentag increase in deaths in the last two triennial intervals, it is eviden that the crude death rates must have been falling by about 4% annually during the immediate pre-war period. Assuming n substantial changes in the population at risk since, a continuance of a 4% fall annually in the deaths was to be expecte if there had been no war, and the actual and expected death up to mid-1942, classified throughout according to the revise International List and method of assignment in force from 1940 may be compared, as below:

Years	First Half			Second Half		
	Expected	Registered	Excess	Expected	Registered	Excess
1936–8*	—	12,199	—	—	10,305	—
1939	11,243	11,859	+ 616	9,497	9,683	+ 186
1940	10,793	13,322	+2,529	9,117	10,338	+1,221
1941	10,361	13,504	+3,143	8,752	10,129	+1,377
1942	9,947	11,828	+1,881	8,402	—	

* Average.

The first half of 1939 registered a substantial excess over th expected figure and also over the first half of 1938, when th deaths numbered 11,412. This cannot be explained by a col winter or by influenza, but whether it had anything to d with the depression and anxieties of the post-Munich perio is a matter for conjecture. The increase over 1938 was almos confined to males between 40 and 70 and females aged 30 t 34. Leaving 1939 out of account, the excess of deaths ove expectation in 1940 totalled 3,750, in 1941 about 4,500, an in the first half of 1942 about 1,900, giving an aggregat excess up to June, 1942, of some 10,000 deaths. Part of th excess in the first halves of 1940 and 1941 was probably du to the exceptionally cold winters of those years; but the differed from 1929 in having no appreciable influenza epidemic and it seems unlikely that more than 2,000 of the excess i the two years can have been caused by the climatic conditions It may be estimated, therefore, that a total excess of som 8,000 deaths is attributable, so far, to the war. The first hal of 1942 showed pronounced improvement over the two preceding years, the number of deaths returning to the 193 level, though still some 1,900 above the number whic would have been reached if the pre-war rate of decline ha continued.

The increase was relatively greatest among children under 15 at which ages the deaths are few in number. Other age group specially affected were men of 35 to 44 and women of 20 to 24 The improvement in the first half of 1942 was apparent i every group, and particularly among females of 15 to 19 an 35 to 44.

Tuberculosis of Meninges and Central Nervous System

The trend of deaths during the 1924–38 period is indicated by the figures below:

Period	First Half of Year		Second Half of Year	
	Average Deaths Occurring	Fall from Previous Period (%)	Average Deaths Occurring	Fall from Previous Period (%)
1924–6	1,708		1,282	
1927–9	1,535	−10 1	1,128	−12·0
1930–2	1,420	− 7·5	1,074	− 4·8
1933–5	1,189	−16·3	860	−19·9
1936–8	1,029	−13·5	746	−13·3

Allowing for the population increase as before, a rate of fall of at least 5% annually was to be expected, leading to the following comparison with the actual deaths registered:

Years	First Half			Second Half		
	Expected	Registered	Excess or Defect	Expected	Registered	Excess or Defect
1936–8*	—	1,062†	—	—	770†	—
1939	959†	969†	+ 10	695†	715†	+ 20
1940	911	1,047	+136	660	839	+179
1941	865	1,422	+557	627	944	+317
1942	822	1,169	+347	596	—	—

* Average. † Classified according to method used from 19-0 onwards.

The increase in deaths from this form of tuberculosis began in 1940 and reached its maximum in the first half of 1941 with an excess over expectation of about 550, the excess then falling to about 350 in the first half of 1942. The total excess of deaths probably attributable to war conditions up to June, 1942, was over 1,500.

The sex–age distribution shows that while every group was affected, males aged 20 to 24, children under 10, and young adult females registered the highest relative increases. The improvement in the first half of 1942 was limited to children, males aged 20 to 24, and young adult females, other groups showing further increases.

Tuberculosis of Other Sites

To complete the picture, the trend of deaths in the pre-war period for all other forms of tuberculosis led to an expectation of an annual fall of about 6%, the numbers of deaths being as follows:

Period	First Half of Year			Second Half of Year		
	Average Deaths Occurring		Change from Previous Period (%)	Average Deaths Occurring		Change from Previous Period (%)
1924–6	2,659			2,304		
1927–9	2,233		−16·0	1,938		−15·9
1930–2	2,013		− 9 9	1,659		−14·4
1933–5	1,670		−17·0	1,349		−18·7
1936–8	1,394		−16·5	1,211		−10·2
	Expected	Registered	Excess	Expected	Registered	Excess
1936–8*	—	1,377†	—	—	1,207†	—
1939	1,216†	1,303†	+ 87	1,067†	1,094†	+ 27
1940	1,143	1,410	+267	1,003	1,188	+185
1941	1,075	1,452	+377	943	1,218	+275
1942	1,010	1,412	+402	886	—	—

* Average. † Classified according to method used from 1940 onwards.

An increase in deaths was again evident early in the war, and the excess over expectation has increased progressively, although the number of deaths fell slightly in the first half of 1942. The total excess from 1940 to June, 1942, probably attributable to war conditions was about 1,500 deaths.

For all forms of tuberculosis the cost of the war up to mid-1942 may thus be estimated as about 11,000 deaths, and the initial waves of respiratory and meningeal tuberculosis deaths seem now to be rapidly declining. But the improvement which was to be expected from the normal downward trend of the pre-war period has yet to be overtaken, and a secondary, perhaps more lasting, wave may yet appear as a delayed result of the increased incidence in active disease of the respiratory form which is believed to have occurred in 1940–1.

ARTIFICIAL RESPIRATION AT SEA

BY

G. H. GIBBENS, M.B., M.R.C.S.
Surg. Lieut., R.N.V.R.

In England we are apt to think that nobody questions the supremacy of the method of artificial respiration introduced by Sir Edward Sharpey-Schafer in 1904. Yet Silvester's method is preferred in Eastern Europe and in Nordic countries, and even in an official British publication (see Refs.) Cordier writes: "All experimenters agree that Silvester's method introduces in the respiratory tract of the apparently dead subject the biggest volume of air." The figures of lung ventilation by these two methods (Table I) are, to say the least, inconclusive, and the almost ideological frenzy in the attacks of the opposing advocates leaves the impression that it is the nationality of the promoter which determines the choice of method.

TABLE I.—*Lung Ventilation in c cm.*

Method	Schafer (1908) Burton-Opitz (1922)	Cordier	Killick and Eve (1933)	Liljestrand et al. (1913)	Bruns (1927, 1930)
Silvester's	175	200–250	200	190	200–280
Schafer's	500	100–150	350–550	under 30	under 30

But the subject is not academic: it is urgently practical. Many otherwise uninjured men are rescued after only a short immersion and yet do not survive. This is undoubtedly because the normal methods of artificial respiration are not very efficient, need many skilled men, and are so tiring that they are not carried out thoroughly or for long enough. It was a relief to read of Eve's rocking method, which can be practised by unskilled men, efficiently and with little fatigue. Unfortunately, the impression has been created that this method requires special apparatus and is not suitable for emergencies outside hospitals. It does not seem to have become widely known. Killick and Eve (1933) have given detailed figures which show the rocking stretcher's superiority over other methods, and it is eminently practicable at sea. It is the object of this article to emphasize the simplicity of the method and to urge its adoption in ships.

Principle of Artificial Respiration by Rocking

In 1932 Eve wrote: "Formerly I regarded the breathing thorax as a concertina bellows; my present work suggests that it resembles rather a cylinder and piston. In older men the cylinder wall is often rigid and is scarcely used in respiration at rest. Hence in artificial respiration it seems much better to exploit the piston action of the diaphragm rather than to try to compress the rigid walls of the cylinder—leaving the piston flapping passively up and down and thus frustrating much of one's efforts to squeeze air in and out of the trachea." Essentially the method consists in laying the patient on a stretcher, which is pivoted about the middle on a trestle, and rocking up and down rhythmically so that the abdominal viscera push the flaccid diaphragm alternately up and down.

Apparatus

Simple apparatus is required. Although Keevil (1934) extemporized successfully, there is little time for invention when a drowning man is on deck. (Scott (1941) quotes Canadian statistics which show that if artificial respiration is given to men within a minute of electrocution 90% recover; if after 6 minutes, only 10% recover. In other words, drowning is as urgent a condition as a spurting artery.) The essential apparatus consists of (1) a plane to which the patient can be fastened; (2) a fulcrum; (3) a stop to prevent the plane sliding to and fro on the fulcrum.

1. A ladder or a door might be used, but for present purposes we can assume that a stretcher is available. The man may be held

on by an assistant; or a rope, suitably padded, may be secured to pass above and below the buttocks to prevent his slipping. We find it simpler to bandage the wrists and ankles to the handles of the stretcher. This is not only firmer but much more comfortable. The upward pull on the extended arms gives an additional Silvester effect to inspiration, and bandaging does not interfere with the "Schafer," which must continue up to the very moment of rocking.

2. A simple and practical fulcrum is the loop of a rope which is secured overhead at two points a few feet apart. Failing an overhead support with space below it, a metal bar may be fixed above a convenient space by means of two ropes, just as an acrobat's horizontal bar is fixed above a stage. The bar must be fairly strong; a broom-handle is not stout enough. However, it is more convenient to use a trestle, for which 32 to 34 in. is an ideal height: when the stretcher handles touch the deck a tilt of 45 to 50 degrees will be given. The trestle's crosspiece should be of round section at both ends Folding trestles are always valuable, and it is well worth having four or six made. In pairs they are useful in bringing stretchers to a suitable height for surgery and major dressings. They can also be employed to maintain a man in the Fowler or Trendelenburg position.

3. A rocking stretcher will slip to and fro on a rope or trestle. In an emergency, and even during rocking, this can be prevented by hammering two nails or staples into the underside of each sidebar on both sides of the rope or crossbar. W-shaped pivots of wood or metal are better, and are easily made: they should be permanently attached below the centre points of the sidebars of several stretchers. The patient's abdomen, which sags below the level of the sidebars, is then prevented from resting on the rope or crosspiece of the trestle These pivots must be shorter than the feet of the stretcher, or the stretcher will be unstable on the deck.

Method of Resuscitation

Immediately the man is rescued from the sea, Schafer must be started on deck. A stretcher is brought and he is rushed below. His wrists and ankles are tightly bandaged to the stretcher handles, Schafer being continued on it right up to the moment when it is hoisted quickly on to the trestle or rope. Any available man starts to rock the stretcher at the rate of a cycle every 4 or 5 seconds—that is, 12 to 15 double rocks a minute. It helps some people if they hum a tango or a slow tune, moving the stretcher at the beginning of each bar. The pumping movement should start abruptly, almost roughly, so that the abdominal contents begin to move early in the stroke. At first the handles of the stretcher should be allowed to rest on the deck at the end of the head-down stroke, the steep angle of 50 degrees giving very efficient chest drainage. Later it is easier to check the handles at about a foot from the deck. This gives a slope of 30 degrees, which is effective and is less work for the operator. If the Novox apparatus is available it should be placed on a table close to the pivot.

When rocking is in progress and the Novox is working, there is time to remove the man's clothes and to rub him down gently. He is covered with warm blankets, if possible an electric blanket. Hot-water bottles are placed around him, and some form of heating apparatus such as a hotplate may be introduced below the stretcher. The outer blanket may be allowed to hang down on each side of the stretcher to keep the warm air below.

Advantages of Eve's Rocking Stretcher

1. *It is Efficient.*—If doctors and first-aid men could make a personal trial of Schafer's, Silvester's, and Eve's rocking methods there would be few who would willingly use either of the older methods for longer than the time taken to fetch a stretcher and trestle. In view of the conflicting figures of earlier writers, the opinion of many volunteers may be of value. All agree that whereas the Schafer method produces a quick expiratory gasp, rocking gives a prolonged expiration of much greater volume. During Schafer it is difficult to auscultate any sound of inspiration, nor can the conscious patient feel it: during rocking it is easily heard and felt. This is so when the methods are practised on conscious men of normal tone: the difference will be greater in unconscious men. Henderson and Haggard (Cordier, loc. cit.) showed that chest elasticity is considerably diminished within 10 minutes of cessation of respiration; and everybody who has used Schafer's method on drowned men will agree that after the first few compressions far less air is expelled than when one is practising on healthy men, elasticity being noticeable by its absence. Schafer demands chest elasticity; rocking does not.

2. *It is Much Simpler and Less Tiring.*—Any bystander can carry on efficiently after watching only a few moments to pick up the rhythm. Consequently it can be kept up for many hours or even days without skilled assistance. Since recovery has taken place after 8 hours of unconsciousness, work must be continued for that time or until rigor mortis sets in. With several casualties, and using the older methods, this may be impossible, for it involves the whole-time employment of many skilled men and their reliefs. Absolutely any "gash hand" can rock a stretcher rhythmically.

3. The patient can be stripped and warmed while rocking is going on. Wounds and burns of the trunk may be cleaned.

4. The stomach and respiratory tract are drained not only by gravity but by the pressure of the abdominal viscera.

5. In patients with wounds of the front of the body which need early treatment the method can be employed with the wounded man lying on his back. In this position the tongue must be held forward.

6. The method can be used for patients suffering from electrocution and gas poisoning, and it is a valuable alternative to the "iron lung" in cases of respiratory paralysis. The tilted stretcher is also useful for gravity drainage of the body cavities. It can be employed for counterextension (Eve, 1939; Blackburne, 1939).

7. It is harmless, and the ribs or liver cannot be injured. At rocking rates over 15 a minute there may actually be hyperventilation; but with the Novox apparatus in position there is no risk of washing out the CO_2. The complete lack of any feeling of sea-sickness during rocking may be explained by Boothby's observation that 75% of sea-sickness can be cured by oxygen inhalation.

Medical officers and first-aid personnel are urged to submit themselves to the rocking. It looks very unpleasant, but they will be amazed to find that there is no uncomfortable strain on the arms or legs—in fact, there is a tendency to go to sleep. For the first time, they will not even have to bother to breathe!

Summary

Eve's rocking method of artificial respiration is described. The patient is placed on a stretcher and rocked through a total angle of 60 to 90 degrees 12 to 15 times a minute. The method is especially suitable for ships, as it is efficient, simple, unfatiguing, and needs no skill. Simple apparatus is desirable and useful, but is not necessary.

The kind help of Surg. Cmdr. J. J. Keevil, R.N., Surg. Lieut. D. de Launay, R.N.V.R., and Dr. F. C. Eve himself is gratefully acknowledged; and thanks are due to the officers and men of this and other H.M. ships for helping in the work with their usual cheerfulness.

J. J. Miller and T. M. Saito (*J. Pediat.*, 1942, **21**, 31) record their observations on 100 children who underwent concurrent immunization with combined alum-precipitated diphtheria and tetanus toxoids and *H. pertussis* vaccine. The results were satisfactory as determined by Schick tests, tetanus antitoxin titrations, *H. pertussis* agglutination tests, and exposure to whooping-cough. Concurrent injections of fluid diphtheria and tetanus toxoids together with *H. pertussis* vaccine yielded relatively poor responses in tetanus antitoxin but satisfactory immune responses with respect to diphtheria and whooping-cough. In tetanus immunization a three-months interval between the first and second injections of combined alum-precipitated toxoids is recommended; and a third injection of alum-precipitated tetanus toxoid without diphtheria toxoid three or four months afterwards.

COMMUNAL FEEDING

A PRELIMINARY REPORT

BY

E. B. GUNSON, M.D., F.R.C.P.

Hostels Branch of Ministry of Supply

The feeding of Royal Ordnance Factory workers resident at hostels adjacent to the factories provides certain data which bear upon the provision and the nutritive value of communal meals. During the past twelve months their number has slowly risen until to-day there are 10,000 occupants in various hostels throughout the country. The great majority are women, but at a few hostels there are a small number of men. The total round figure of 10,000 includes Ordnance Factory workers and staff. Most of the workers have previously been occupied in industry, although a considerable number have been drawn from distressed areas and for long periods had been either unemployed or not fully occupied.

Medical Examination

All the entrants to the factories are medically examined, and no workers are admitted who are found to be suffering from gross defects or active disease. At the same time the average standard of physique and health on admission is not high. After three months' stay at the hostels the management and the sisters in charge of the sick bays report a notable improvement in the general appearance and well-being of all the girls, particularly in those who came from distressed areas and who were evidently below par on admission. No precise data are available to support this general observation except the sick-bay returns, which indicate a very low incidence of morbidity (Table I).

TABLE I.—*Weekly Hostel Sick-bay Returns from March 28 to June 27, 1942*

Date	Total Occupants	Total Patients (excluding those with Industrial Rashes)	Total suffering from Scabies
27/6/42	10,009	138 (1·37%)	6
20/6/42	10,009	155 (1·54%)	12
13/6/42	8,973	147 (1·64%)	18
6/6/42	8,973	124 (1·38%)	16
30/5/42	8,973	113 (1·26%)	17
23/5/42	8,847	120 (1·35%)	16
16/5/42	8,847	137 (1·55%)	11
9/5/42	8,847	136 (1·54%)	13
2/5/42	7,753	101 (1·30%)	6
25/4/42	7,320	120 (1·64%)	16
18/4/42	7,320	124 (1·69%)	16
11/4/42	7,320	149 (2·04%)	7
4/4/42	5,687	117 (2·06%)	9
28/3/42	5,687	124 (2·18%)	7

From this table patients suffering from industrial rashes are excluded. The number of scabies cases, all of which are included, is so small as not appreciably to affect the position. Only 2 cases of pulmonary tuberculosis occurred during the period under review.

Hostel Regime

The low incidence of morbidity among hostel occupants is attributable in large part to the general regime in operation. The girls, who mostly work on three shifts, retire at regular hours and get an ample measure of sleep and rest. Opportunities are afforded for rest and exercise. Special facilities for recreation are provided, and every hostel has a library. The girls have access to a well-equipped laundry, and an up-to-date hair-dressing establishment operates on a low scale of charges. The social halls of the hostels all have an excellent dance floor. The hostels are provided with regular entertainment by dance bands, orchestras, and concert parties.

The residents elect a committee of their own to co-operate with the management in the provision and operation of all these amenities, and they take a very large and direct share in the running of the hostel. The managements are at great pains to meet all reasonable wishes of the hostel occupants. As a hostels medical officer I have had the opportunity of staying in these hostels, of examining their working conditions closely, and of meeting the girls. I have observed and been impressed by the general feeling of well-being and contentedness which they manifest. The impressive feature of hostel life, however, is to a medical observer the communal feeding. The conditions under which this is carried out make it of particular importance at this juncture, when the provision of communal meals is being extended to an increasing proportion of the population.

Catering Management

Great care has been taken to appoint to the charge of catering departments highly qualified and experienced managers. These catering managers, in consultation with the general management, have given very detailed attention to the menus which they provide. Under the national system of rationing there is not a wide range of foodstuffs which can be provided, and the supplies are limited. Rationing operates rigidly in these hostels, as in private homes, but there is one great distinction, in that all the ration cards are taken over by the management and the rations are pooled. Table II indicates the frequency with which the more important protective foods are supplied.

TABLE II

(*a*) *Milk.*—Served in custards, milk puddings, and tea or coffee for at least one meal a day, and, in addition, on porridge or corn flakes each morning.
(*b*) *Cheese.*—Served 3 or 4 times a week. *Butter.*—Served for tea and supper; *margarine* for breakfast.
(*c*) One egg per person each week.
(*d*) *Fruit.*—Fresh rhubarb twice a week; prunes and apples once a week.
(*e*) *Green Vegetables.*—Every day: the varieties on the market at the time.
(*f*) *Salads.*—About 5 times a week.
(*g*) *Meat.*—One meat dish daily. *Liver.*—There has not been enough available to supply this for meals recently.
(*h*) *Fish.*—2 or 3 times weekly.
(*i*) *Standard Bread.*—Unlimited supply.

Table III, supplied by an average small hostel, indicates more precisely the daily consumption of the listed articles of food.

TABLE III

(*a*) Milk, 1/2 pint.
(*b*) Cheese, 2/7 oz.; butter, 3/14 oz.; margarine, 16/35 oz. Total, 67/70 oz.
(*c*) Eggs, 1/7.
(*d*) Fruit, 18/25 oz. (all varieties).
(*e*) Green vegetables: Cabbage, 3/14 lb.; cauliflower, 3/80 lb. Total, 141/560 lb.
(*f*) Salads: Lettuce, 18/285 lb.
(*g*) Meat, 9/7 oz.; liver, 3/7 oz. Total, 12/7 oz.
(*h*) Fish, 8/7 oz.

A menu for the week ending June 27, 1942, is shown below. The preparation of these menus is a matter to which the general management and the catering management give particular attention. They have the advantage of seeing and discussing menus drawn up and provided at other hostels, and all the menus are considered from the point of view of providing, so far as possible, a sufficiency of the protective foods. The major difficulty which faces the catering manager arises from the shortage of fresh fruit and, in some cases, a relative shortage of green vegetables. It is a general practice in these hostels to pay particular attention to the preparation of vegetable soup, and all the vegetable water finds its way into the stock-pot, together with as many varied greens, carrots, and other suitable vegetables as are available.

Specimen Menus for the Week Ending June 27, 1942

June 21.—Breakfast: Porridge or puffed wheat, scrambled eggs, bread-and-butter, jam, marmalade, tea. Dinner: Oxtail soup, roast lamb, mint sauce, cauliflower, carrots, baked or mashed potatoes, ginger sponge, custard, tea or coffee. Tea: Currant bread, bread-and-butter, tea. Supper: Vegetable soup, cold meat, salad, mashed potatoes, rhubarb tart, custard, tea or coffee. Snack: Vegetable soup, potato cakes, cheese, bread-and-butter, tea or ovaltine.

June 22.—Breakfast: Porridge, fish or jam, bread-and-butter, tea or coffee. Dinner: Brown soup, vegetable stew, potatoes, steamed date pudding, tea. Tea: Bread-and-butter, cake, tea. Supper: Lentil soup, grilled liver, potatoes, cabbage, pudding, tea or coffee. Snack: Soup, buttered toast and cheese, tea or coffee.

June 23.—Breakfast: Porridge, liver, bread-and-butter, tea. Dinner: Vegetable soup, roast beef, cabbage, baked or boiled potatoes, steamed jam pudding. Tea: Bread-and-butter, cake, tea. Supper: Tomato soup, roast beef, cabbage, potatoes, rhubarb and custard, tea or coffee. Snack: Soup, chips, bread-and-butter, tea or coffee.

June 24.—Breakfast: Porridge, bacon, bread-and-butter, tea. Dinner: Soup, roast beef, baked and boiled potatoes, cabbage, tapioca whirl, tea or coffee. Tea: Cake, bread-and-butter, tea. Supper: Soup, macaroni and cheese, mashed potatoes, almond sponge, custard. Snack: Soup, cottage pie, bread-and-butter, tea or coffee.

June 25.—Breakfast: Porridge, rissoles, bread-and-butter, marmalade or jam, tea or coffee. Dinner: Vermicelli soup, cold ham, cabbage, semolina and custard, tea or coffee. Tea: Scones, bread-and-butter, jam, tea. Supper: Mannastorme soup, cold roast beef, lettuce, beetroot, jacket potatoes, steamed chocolate pudding, tea or coffee. Snack: Soup, fried cheese sandwiches, tea.

June 26.—Breakfast: Porridge, boiled eggs, bread-and-butter, tea or coffee. Dinner: Kidney soup, Irish stew, haricot beans, potatoes, rhubarb tart and custard. Tea: Cake, bread-and-butter, tea. Supper: Vegetable soup, Irish stew, cottage pie, cabbage, potatoes, steamed marmalade pudding, custard. Snack: Vegetable soup, lentil cutlets, lettuce, pickled cabbage, tea or coffee.

June 27.—Breakfast: Porridge, liver, sausage, or bacon, bread-and-butter, jam, tea. Dinner: Potato soup, steamed fish, parsley sauce, mashed potatoes, rice pudding, tea or coffee. Tea: Currant loaf, bread-and-butter, tea. Supper: Vegetable soup, roast lamb, mint sauce, cabbage, mashed potatoes, Swiss roll, custard, tea or coffee. Snack: Soup, sardine sandwiches, tea or coffee.

Commentary

Catering Management.—The general standard of trained catering managers is high. At the same time there are evident weaknesses in kitchen methods.

Nutritive Value of Meals.—Specific instruction by nutrition authorities on the nutritive value of meals would be welcomed by caterers. This could with advantage include cold dishes and hot meals.

Cold Salads.—These are not always well chosen or effectively served, and there is not a sufficiently wide appreciation of the food values available in salad form. I consider instruction is needed in this connexion.

Stock-pot.—This is a wartime necessity and must be given a higher status in the kitchen. While the value of vegetables and vegetable water is appreciated, there generally is lacking any precise knowledge of the effect of boiling on foodstuffs. Great variation is to be seen in different kitchens. A few stock-pots and soup-containers are well handled, but it is doubtful whether the bulk of the soup that is served contains the qualities that the food used could provide. Too much water is employed in the preparation, or too little; the soup is boiled either longer than is desirable or not long enough. In fact, soup preparation is still considered too simple a matter to particularize, and it calls for more attention from the catering management.

Fish and Chips.—Fish and chips is the *pièce de résistance* of the factory working-girl. My view is that the girls are good judges of body needs. Fats under wartime conditions are in minimal supply, while both fish and chips are excellent foods. The girls describe the dish as "tasty," but it is no more so than many dishes could be made if properly cooked. The savoury element in fish and chips points the way to the better handling of savoury dishes.

Cheese.—Cheese dishes, generally speaking, are unpopular in the hostels, though in some cases they are appreciated and favourably commented upon. I have sampled these dishes in various hostels, and it does seem that while as a rule they are well prepared, they are produced very differently by different caterers. Where cheese dishes are rejected and unpopular, these have a particular character that does not appeal to the girls' taste. The importance of cheese and its availability under present circumstances make it desirable that this aspect of catering should be looked into.

Conclusion

In general the types of food necessary for health are well appreciated, and these are supplied to the limit to which they are available. The food provided appears fully to meet the health needs of the residents. The catering management is in good hands, but more precise direction in respect to particular aspects of preparing some of the foodstuffs is desirable and would be welcomed.

The preparation and provision of a communal meal is a practical and economic proposition so far as Royal Ordnance Factory workers living in hostels are concerned. In fact, the health of the girls resident in these hostels notably improves, and this improvement can be attributed, in part at least, to the manner and method of the feeding arrangements.

Medical Memoranda

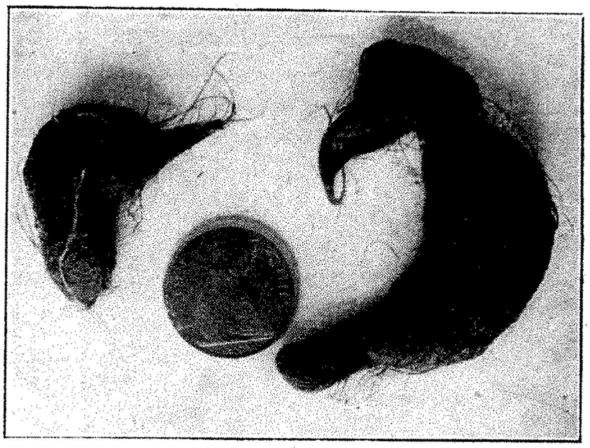
Unusual Case of Intestinal Obstruction in a Child

The following case appears to be uncommon enough to warrant record.

CASE HISTORY

The patient, a girl aged 3, was admitted to the Whitehaven and West Cumberland Hospital with a history of 4 days' abdominal pain and vomiting. The pain, which was intermittent in character, was becoming less frequent, but the vomiting, which had at first merely consisted in the return of any fluids given by mouth, had become bilious. The bowels had not been opened for 4 days. The child, though obviously ill, was quiet between the attacks, the temperature was normal, and the pulse rate 140. She was not markedly dehydrated. The tongue was normal; the abdomen was distended and tympanitic. There was no visible peristalsis and no definite tenderness. A small hard mass was palpable in the right iliac fossa; the lower bowel was empty. The white cell count was normal. A diagnosis of intestinal obstruction was made, and it was thought that this was probably due to adhesions to tuberculous glands in the right iliac fossa.

A general anaesthetic (open ether) was administered, and a right lower paramedian incision made. The abdomen contained slightly turbulent free fluid. A distended and inflamed coil of small intestine presented. This was followed down, and in the lower part of the ileum a hard mass about the size of a mouse was found in the lumen; there was a similar smaller mass a few inches further down, and below that the bowel was collapsed. The larger mass was firmly impacted and fixed, but it was possible to "milk" the smaller one back to the larger fixed one. The bowel over this was friable, and the peritoneum had split longitudinally. The bowel was clamped and incised and the two foreign bodies removed. These were found to consist of tightly matted hair, with strands of cotton interwoven (see Fig., compared with a penny). In view of the state of the bowel it was considered advisable to do a resection, and about 6 in. of bowel was removed and an end-to-end anastomosis performed. The abdomen was closed without drainage.



The child was very ill for the first 3 days and vomited twice. After this she started to improve, and a week later the bowels were moved. There was a slight residual superficial infection of the wound. This quickly resolved, and the patient was discharged 3 weeks after operation.

COMMENT

Cases of hair-ball in the gastro-intestinal tract are relatively uncommon, and those which have been described have usually been in the stomach and in older persons. The condition is often associated with mental disorder. The child under discussion is of a highly strung nervous type, and had been known to chew her hair, though not for several months previously. Immediately she came out of the anaesthetic she started to clutch her hair, which was short. It was kept covered for the first few days after operation and the parents were warned to watch the child carefully in future.

The condition, which is known as trichobezoar, is found in domestic animals and cattle; it is also described as occurring in fowls (Hutyra and Marek) due to feathers, and is said to be caused by protein deficiency in the diet.

V. C. J. Harris, B.A., M.B., F.R.C.S.Ed.,
Honorary Surgeon, West Cumberland Hospital.

Reviews

PREVENTION OF AIR-BORNE INFECTION

Aerobiology. Edited by Forest Ray Moulton. (Pp. 289. No price given.) Washington: American Association for the Advancement of Science, Smithsonian Institution Building.

An imposing volume entitled *Aerobiology* contains 36 papers by a total of 55 authors presented at a meeting of the American Association for the Advancement of Science held in Chicago in September last. It is a sign of the wide interest now being taken in air-borne infection and its prevention that the study of this subject should now be given the status of a distinct science. These papers deal with many aspects of it, from the origin and behaviour of infected particles to their destruction or elimination. There are many excellent photographs of the products of sneezing and coughing, reminiscent of those obtained by Bourdillon and Lidwell in this country (including one showing that droplets can traverse a gauze mask), studies of the subsequent behaviour of particles of different size, and a discussion of their fate when inhaled: an important fact is that the smaller the particle, the more likely is it to reach the lungs. A paper on air-conditioning reveals that down-draught ventilation has the disadvantage of throwing floor dust into suspension: experiments are described with filtered air which show that it is possible to maintain Caesarean-born animals for periods up to 6 weeks in a completely germ-free state—a technical achievement of a high order. No fewer than 12 papers deal with ultra-violet light as a means of air disinfection, and there is sound evidence of its efficiency, both when used more or less diffusely and when applied as a barrier between the patient and his surroundings. The most elaborate practical installations described are cubicles for infants furnished either with filtered air or light barriers; the general adoption of such systems would of course be enormously expensive. The only method of chemical air disinfection considered is the use of propylene glycol: it certainly seems at first sight—for this method is newly discovered—that for efficiency combined with complete harmlessness propylene glycol vapour is at present unequalled.

This is "intramural" aerobiology: its "extramural" aspect, the inclusion of which justifies the use of so broad a title, is dealt with in 8 papers on the atmospheric distribution of insects, pollen, fungus spores, and bacteria. Special devices attached to aeroplanes were required for some of these studies, and much of the information is of great general interest, especially that on the dissemination of plant pathogens, such as the spores of wheat rust, over enormous distances. Medically, its chief interest lies in the fact that both pollens and fungus spores are potential allergens.

For anyone who either has not followed the rapid development of this subject, or wishes to study it more deeply with the aid of the numerous references given, this volume is indispensable.

ABNORMALITIES OF SPEECH

Speech and Voice: Their Evolution, Pathology, and Therapy By Leopold Stein, M.D. With a foreword by J R. Rees, M.D. (Pp. 233. 15s.) London: Methuen and Co. 1942.

Books on the physiology of speech and the treatment of its defects and abnormalities are apt to be diffuse, sometimes exploit pet theories, and are sometimes based upon insufficient scientific training. *Speech and Voice*, by Dr. Leopold Stein, is free from these common faults. He expounds his subject in excellent clear English, though this is not his mother tongue, he rides no particular hobby-horse, and his book is the work of an accomplished physician. The foundations are laid elaborately, and the reader must regard with respectful awe the extent of the author's reading in biology, embryology, philosophy, philology, psychology, and neurology, besides the references to general literature. In neurology the author depends largely upon the writings of Hughlings Jackson, to whom he turns again and again to explain the nature of abnormalities in speech. He recognizes the importance of the psychological background and that psycho-analysis may be of service, but he does not labour this aspect unduly. The treatment he recommends has a proper scientific basis of diagnosis and avoids empiricism.

Such a flood of loose writing and jargon has been released on these matters, especially in relation to the treatment of stammering, that this carefully prepared and erudite work is the more welcome, and will be of great value to speech therapists, because the basic facts, drawn from various scientific sources, are clearly and accurately stated. All interested in education, child welfare, and the neurology of children will find the book interesting.

HISTORY OF CARDIOLOGY

A Short History of Cardiology. By James B. Herrick. (Pp. 258; illustrated. $3.50 or 19s. 3d.) Springfield and Baltimore: Charles C. Thomas; London: Baillière, Tindall and Cox. 1942.

This survey of the history of cardiology by Dr. James B. Herrick is a remarkable book. In the first place, it is written by one of the masters of clinical cardiology who throughout a lifetime has watched the evolution of modern knowledge of heart disease and who himself has made important contributions to it. Secondly, the outline here presented with a light but sure touch, and with a blend of philosophy, reflection, and occasional gentle irony, covers a vast retrospect embracing the development of cardiology during more than 2,000 years.

Dr. Herrick shows how the discovery of clinical methods and the extension of necropsy studies hastened the progress of the science in the later years of the seventeenth century, and how in the time of Laennec and in the decades which followed up to the first half of the nineteenth century great strides were made in physical diagnosis. The microscope, and later the discoveries of bacteriology and radiology, marked in turn the period from Virchow to Pasteur and Roentgen. The advances in cardiology during the present century have received little attention. The author points out that this era of instruments of precision and laboratory methods has called for a revision of many of the earlier conceptions of the anatomy and physiology of the heart. But this epoch, which is still in progress, cannot yet be viewed in the perspective appropriate to a work such as this. Dr. Herrick's graphic style in his description of personalities—as, for example, in the lives of James Hope and William Stokes—lends additional interest to the text. The 48 reproductions of engravings and portraits are well chosen and beautifully executed. A feature of the work which will delight readers in these days of small print and cramped margins is the excellent typography.

Notes on Books

Hydrogen Ions, by H. T. S. BRITTON, D.Sc., appears in its third edition now bound in two volumes (Chapman and Hall, 36s. each volume). The book has become well known among teachers, students; and also many technicians, for there are few technical processes which are uninfluenced by variations in the concentration of ionized hydrogen. The book presents a comprehensive theoretical treatment of the subject developed from basic principles and extended to include the most modern views. It describes the various methods and apparatus used for the determination of *p*H, and discusses particularly their applicability to different circumstances, with remarks on their merits and limitations. To the new edition is added a useful chapter on oxidation and reduction systems. The book gives abundant information on the influence of *p*H on the technical operations of a number of industries of many kinds; they include the electro-deposition of metals, the tanning of leather, sugar manufacture, brewing, baking, and other operations.

Abstracts of dissertations approved for the Ph.D., M.Sc., and M.Litt. degrees in the University of Cambridge during the academical year 1940-1 are published in the usual form by the University Press. Ten of the dissertations are grouped together under biochemistry, one appears under anatomy, and one under pathology.

No. 7 of Volume II of *The Advancement of Science*, published by the British Association, Burlington House, London, W., at 5s., includes the first interim report of the Association's Committee on Post-war University Education, but by far the greater part of this number is devoted to an account of the conference on mineral resources and the Atlantic Charter, held last July under the presidency of Sir Richard Gregory.

BRITISH MEDICAL JOURNAL
LONDON
SATURDAY DECEMBER 26 1942

INFLUENZA

It is now some two years since London was under almost nightly fire, and, although most Londoners have rational fears for the future, few have emotional fears. Logically there is—as minor Ministers remind us at week-ends in those dreary speeches which almost reconcile us to illegibly small print—no reason why London should not be " blitzed " again; indeed a quite plausible argument could be made in favour of the hypothesis that the likelihood of mass attack varies inversely as the enemy's hope of victory. But in fact the people of London do not worry very much about a blitz; time is a healer. The same kindly obliteration of fears and sorrows by the hand of time has reduced the word " influenza " to its customary semi-humorous role. Pan is piping, not stamping on the earth. Yet, here too, quite plausible arguments can be drafted for the view that the menace of influenza on a pandemic scale is greater than it was in 1918. If, for instance, the great virulence of the last pandemic were due to the opportunities of commingling of men of like ages but from widely different environments, leading to the emergence of a strain of virus of special potency, certainly the circumstances of our time are not reassuring. If exclusion from the west of Europe is an epidemiological advantage, it will be, we are sanguine enough to hope, only a temporary advantage. It is, therefore, opportune to digest the teaching of past experience, some of it quite recent experience, and to see how we now stand, on what might possibly be the eve of another major epidemiological event. Drs. Burnet and Clark have written a monograph[1] for which we have nothing but praise; it is a lucid account of researches old and new in which the senior author has had an important share, and sets out necessarily technical facts in a manner which can be understood by those without recent experience of laboratory work. It is evidently not possible within the limits of an article to abstract the contents of a monograph; it should be read. We shall do no more than try to convey the impression made by such a reading.

The isolation in 1933 of the virus which has been renamed influenza virus A made an epoch in the history of research. Since then much work has been done, and now strains of virus A are known which may be regarded as intermediates between virus A and the virus B isolated in 1940. Although since 1933 no epidemic on the scale of 1918-19 has occurred, there have been epidemics of a disease which, judged by the pre-1933 criteria, would be regarded as homogeneous epidemics of influenza. Often, but not always, in these a strain of virus has been isolated, and the clinical individual features of the disease have been produced by deliberate or accidental infection with virus. It is plainly impossible to prove that the primary aetiological factor of the 1918 pandemic was a virus infection, but, as Burnet and Clark show, there is no feature of that epidemic which is inconsistent with a hypothesis which analogy makes reasonable. The events of 1918 are differentiated from later and earlier experience by (*a*) the change of age incidence and fatality, (*b*) the greater dispersiveness, the former being the more drastic. It is possible to think that the phenomena were due to the emergence of strains qualitatively different from their predecessors—perhaps the acquirement of ability to infect alveolar epithelium and vascular endothelium as well as ciliated epithelium. " Both changes can reasonably be ascribed to the unprecedented opportunity afforded for the spread of infection in large bodies of men from various parts of the world, and in particular to the arrival of American troops in Europe."

Are we in a better position than our predecessors to control influenza? Burnet and Clark think that the experience of Australia in 1918-19 shows that maritime quarantine may at least delay invasion, and (if we are dealing with a *materies morbi* the biological characters of which change rapidly) this is important. If quarantine is to be useful it must be simplified, and an essential point is to determine the duration of infectivity. The development of the amniotic technique has made practicable an investigation on a fairly large scale which should, in the authors' opinion, be carried out as soon as opportunity offers. Specific prophylactic immunization naturally appeals to our sense of drama, but the authors are far from being facile optimists. There is little doubt that it is technically possible to prepare virus of any grade of human virulence, but the practical problem of choosing from the variety of possible strains that which will be effective in the given circumstances of an outbreak is another matter. Most amateurs of chess can foresee adequate replies to the move the " master " might make; it is the move he did make which dismays them. Probably by far the most important precautionary measure is so to mobilize our scientific forces that at the earliest possible moment we may understand the move the great enemy has made, for, as in chess, it is not always the one move which is decisive but the following sequence.

If this survey of the position gives no ground whatever for optimism, it at least makes plain that we are not now so completely helpless as we were a generation ago.

HOURS OF EMPLOYMENT AND HEALTH

In the latest report of the Chief Inspector of Factories[1] the subject of hours of employment is discussed by Miss F. I. Taylor, a deputy chief inspector. She points out that the number of Emergency Orders granted, under which there are modifications in the hours of work permitted by the provisions of the Factories Act, nearly doubled between 1940 and the early part of 1942, and about 10,000 factories now have permission to employ women and young persons over the age of 16 either on a system of day and night shifts or for more than 48 hours a week. The permitted hours ranged from 55 to 60 a week in rather less than half the factories, so they do not show a substantial improvement on the hours recorded in the report of the Chief Inspector for 1940. Still, there was a slight improvement in the later months of 1942, and it must be remembered that the fact that permission has been obtained for certain hours does not necessarily mean that these hours will always be worked. On the other hand, Miss Taylor regretfully admits that in some factories women and young persons were employed continuously for 60 or nearly 60 hours a week, and it is difficult to understand why the Factory Department sanctions such hours, except for a very short period in a time of great emergency. The effects of long hours on casual absenteeism were revealed at a factory where the women worked for six full days a week, with a total of 56 or 57 hours. The absenteeism became so acute, owing to the women needing time for shopping and domestic duties, that the firm introduced a rota system, whereby the women had only 5½ days of work a week and a total of 52 hours. Since the change the casual absenteeism has practically ceased. The effect on output is not stated, but a firm is mentioned where the women were employed on making hand-grenades, and they were found to produce more grenades when working a 50-hour week than on a 56-hour week. At another factory, where scientific glass was made, the hours of work were reduced from 9 hrs. 50 mins. a day to 8¼ hrs., and after two weeks the majority of the women were producing as much in the shorter hours as they had done in the longer ones.

The hours sanctioned by the Factory Department are often exceeded illegally, especially in the employment at night of young women under 18 and of boys under 16. In one case boys under 16 were employed on night shift for between 60 and 70 hours a week, and in another girls of 16 and 17 were employed on alternating day and night shifts with an average weekly total of 63 hours. Again, adult women were employed in the assembling of motor vehicles for 70 hours a week. In these and many other cases proceedings were taken by the inspectors against the occupiers, and there must be numerous instances of illegal hours which escape their notice altogether. Many married women with domestic responsibilities are taking up employment on a part-time basis. The most popular plan has proved to be a two-shift system by means of which two sets of women put in, between them, a full day of work between 8 a.m. and 6 or 7 p.m. An extension of this method is to work three short shifts per day, the hours of the shifts being 7 a.m. to 12 noon, 12 to 5 p.m., and 5 to 10 p.m. Or, again, four short shifts may be worked, running from 6 to 10 a.m., 10 a.m. to 2 p.m., 2 to 6 p.m., and 6 to 10 p.m. Another alternative is to get the women to work "overtime" hours in the evenings, after the ordinary workers have left at 5, 6, or 7 p.m. The women continue the work till 9, 10, or 11 p.m.

The long hours of work must often have an adverse effect on the health of the workers, but Dr. J. C. Bridge, the Chief Medical Inspector, maintains that, speaking generally, there is no reason to think that it has been so affected. He says that if industrial employment had produced deterioration in health there would have been an obvious increase in the notifiable infectious diseases, and that such has not been the case. Yet on another page of his report he briefly mentions the increasing incidence of tuberculosis among young adults, particularly females. What more striking evidence can we have of the adverse effects of war conditions than the vital statistics of Dr. Percy Stocks,[2] which show that the tuberculosis mortality of young women (aged 15 to 25) rose 16% between 1939 and 1941? It is apparently dependent in considerable degree on hours of work, for Drs. Laidlaw and Macfarlane[3] found that the pulmonary tuberculosis cases in Glasgow among industrial workers in general increased 21% between the same periods, while those of clerks and shop employees increased only 3%. Now these two classes of employees mostly worked for 48 hours a week or less, whereas the industrial workers were usually employed for 56 hours or more, and in many cases for 72 hours. Dr. Bridge considers that the maintenance of health is largely attributable to the steps taken to provide meals in the factory canteens at a reasonable rate; but other and perhaps more important factors must depend on the wise food policy of the Government, and on the fact that good wages are now being earned by hundreds of thousands of workers who were previously unemployed and suffering from malnutrition.

In regard to specific cases of poisoning, there were 41 cases of T.N.T. poisoning in 1941, of which 12 were fatal. There appears to have been a considerable increase on 1940, but cases of anthrax fell from 37 (5 fatal) in 1940 to 22 (3 fatal), probably owing to a reduction in the import of infected material. A serious increase in the number of gassing accidents is noted, there being nearly 200 cases and 10 deaths more than last year. The greatest increase was in cases of carbon monoxide poisoning—258 (24 fatal), compared with 162 (20 fatal) in 1940. Of the excess cases, no fewer than 56 (9 fatal) were due to miscellaneous causes such as coke braziers and exhaust gases from internal-combustion engines. The number of dermatitis cases has risen, owing to the increase in the number of entrants into industry and of materials used which may give rise to dermatitis, but Dr. Bridge deprecates the somewhat alarmist view that is taken of this skin condition. He points out that in the vast majority of cases the harm to the skin caused by the irritant quickly subsides on removal of contact, and that with appropriate treatment and protection of the affected part continuance at work, even at the same work, is not altogether impracticable. Success depends on the co-operation of the individual worker.

GASTRO-INTESTINAL CONCRETIONS

It is pleasant at times to turn from the everyday to the out-of-the-way in medicine. Most practitioners at one time or another run across a number of odd swallowed foreign bodies ranging from buttons or kirby grips to screwdrivers and watches, but few in this country are likely to have heard of the "persimmon belt" or the unusual condition of persimmon bezoar. Persimmon is the American date-plum. Bezoar is a Persian[1] term used to describe concretions of various kinds found in the stomach and intestines of animals and man, and the persimmon belt is a general description given to a part of the United States in the Middle West with Kansas, Oklahoma, and Texas as its western boundaries. It is in the persimmon belt that persimmon eaters, and especially those who impatiently eat them before they are ripe, may once in a while develop a persimmon concretion in the stomach. The risk, however, would not appear to be great, for under 120 cases have as yet been recorded in the literature, and Feldman in Baltimore observed none among 30,000 *x*-ray examinations of the gastro-intestinal tract. Chont, living in the heart of the persimmon belt and facing the daily risks of phytobezoar formation, now records a further series of 9 cases and makes a number of interesting observations upon this condition. While hair balls (trichobezoars) are more frequent in women—a case in a girl of 3 is recorded by Mr. V. C. J. Harris in this week's *Journal*—persimmon bezoar is mainly confined to men, and the coincident occurrence of gastric ulcer is very high among these patients. Gastric acidity is mostly normal, and the *in vitro* formation of bezoars was found by Chont[2] to demand the presence of acid, though pepsin was not essential; in weak acid unripe persimmon fruit beginning to solidify in 24 hours. The radiological diagnosis was in most instances simple, and in some the concretion was of considerable size, measuring up to 5 inches across. In a case described by Guthrie a large bezoar had broken in two and one portion had become impacted in the jejunum, causing some degree of actual obstruction. This writer mentions a number of other types of gastric concretion, among which is included the shellac bezoar found among painters who drink alcoholic solutions of shellac; this apparently forms by precipitation of the resins if the addict rashly reverts to the more usual custom of drinking water. One excessively rare occurrence is the formation of a bezoar caused by prune or raisin seeds and skins, by celery or salsify fibres, by pumpkin, and once by peaches. As with other things rarity brings its reward, and prices of bezoars—when supplies were available—were apt to be high in olden times, for they enjoyed a great reputation as remedies for poisonous and pestilent diseases. Even the temporary use of small pieces cost a high figure; in the scale of values the porcupine and monkey bezoars held the place of honour. The peach bezoar must be almost beyond price.

HIGH FLYING FOR WHOOPERS

Some three years ago an article in the German medical press described how children with whooping-cough had been taken up in aeroplanes with resulting amelioration of their symptoms.[1] Now two members of the Berne school medical service record[2] their investigation of this therapy in Switzerland, with the co-operation of local aviation and transport companies. P. Lauener and E. Maeder made the first attempt in the late spring and the early summer of 1939, but weather conditions were particularly unpleasant, and it required further studies in 1940 and 1941 before enough patients had been obtained to make statistical analysis possible. The patients were mostly school children, but some infants and toddlers and a few adults were included in the series. Each flight lasted about 90 minutes, of which about 40 were spent at a height of approximately 11,000 to 12,000 ft. A sudden transition to great height by a rapid ascent was ruled out as being too dangerous. The flights generally took place in the mornings, and observations on weather conditions and humidity were included in the records. Only a few children showed any apprehension before going up, and this quickly disappeared once they were in the air. The infants and small children usually went to sleep at a height of about 6,000 ft., and they woke again only on landing. About 30% of the children and adults experienced some nausea—the only disturbance caused by the flights—and none of the infants was sick. The authors collected 250 patients all in the paroxysmal stage of whooping-cough. In 57 cases (22.8%) an abrupt cure took place after one flight. Within at the most two or three days, and often immediately after the flight, these patients stopped whooping, and their astonished parents exclaimed that with the flight the whole picture of coughing and vomiting "had blown away." Another 80 (32%) were "cured" more slowly, a period of eight days being necessary to secure freedom from paroxysms. Thus in 55% of cases the flights may be said to have given good results in a short enough time to justify the conclusion that they had some therapeutic effect. A further 411 cases were improved; in 69 there was no change. Two of this last group were taken up a second time with good effect, and 4 children were taken up as a prophylactic measure, none developing the disease. Of the series 12 were adults, and all but 1 were benefited. Here the possible psychological effect has to be considered, but this could not be present in the case of infants, only 10 out of 34 showing no appreciable improvement. No very clear relation with weather conditions was established: some days gave better results than others, and it appeared that low humidity was better than high.

The Berne authors conducted two further series of observations, one on the Jungfrau and the other in low-pressure chambers. A group of 23 children and 1 adult were taken up by railway to a height of over 10,000 ft. and kept there for three hours before returning to Berne. The results were disappointing. In 16 out of the 24 cases there was slight improvement but no sudden disappearance of symptoms as after the aeroplane flights. The results with the low-pressure chambers were better. A group of 68 children were studied. They spent 60 minutes in the pressure chamber, with about 15 minutes for decreasing the pressure, 30 minutes at a pressure corresponding to a height of about 14,000 ft., and another 15 minutes coming back to normal pressure. Sudden "cure," as after the aeroplane flights, occurred in 31%, undoubted improvement in 50%, no improvement in 16%, and in 3% the disease became worse. Clearly the low-pressure chamber had advantages over the aeroplane, for it is independent of weather conditions. The psychological effect of the flight is also eliminated. When we recall that during the first half of 1941 between 3,000 and 5,000 cases of whooping-cough were being notified weekly in this country, aircraft firms, we imagine, would look upon the opportunity as one not to be sneezed at. Lauener and Maeder do not explain how this unusual method of treatment works. Does exposure to low pressure have an effect on *H. pertussis*? Or does it break a link in the chain of an ill-conditioned cough reflex?

HOSPITAL CONTRIBUTORY AND PROVIDENT SCHEMES

Two brief reports that have reached us throw sidelights upon the revolutionary changes in health and medical services which underlie the Beveridge plan. While Sir William Beveridge proposes that 100% of the population should be entitled to domiciliary and hospital treatment as part of the benefits of a universal compulsory insurance scheme, the Bristol Hospitals Fund publishes an interesting analysis of hospital contributory schemes—that voluntary system of comparatively recent growth which provides for the collection of regular contributions towards the cost of hospital care and treatment from some 10,000,000 people.

The author of the Bristol memorandum, Mr. John Dodd, sees two dangers ahead. One is that financial provision for hospital and ancillary services should be grafted on to national health insurance and be operated through a multitude of competing approved societies. But the other danger is that the present haphazard and inadequate methods should indefinitely continue. He urges regionalization of hospital services and of hospital finance, with only one contributory scheme in each of the divisions into which the several regions would be split up, and also that all contributory schemes should pledge themselves to observe minimum standards of contribution and of benefit, to provide unlimited services in general wards for acute sickness and to practise universal reciprocity. In the second report the British Provident Association, whose subscribers are people of moderate means, discusses the position of provident schemes in the future. Its executive council and its medical advisory board are strongly of the opinion that, whatever form future medical services may take, the two principles of free choice of doctor, hospital, and nursing home and of non-interference in the relationship of doctor and patient should be maintained. The council has circularized its subscribers on this subject, and reports that there is a large body of opinion that the facilities available for medical and institutional treatment for those with moderate incomes are in need of improvement in two main directions —namely, suitable institutional accommodation at reasonable charges, and means of mitigating the effects of the financial burden of serious illness. They think also that the extension of pay-bed provision in voluntary hospitals is the best method by which institutional accommodation should be secured, and that the development of provident schemes on similar lines to those operated by the association, providing for free choice of doctor and institution, should form an essential part of any improved service.

CHEMOTHERAPY FOR TUBERCULOSIS

Tuberculosis is the most important single infection which has not hitherto been brought within the scope of sulphonamide treatment. Its chronicity, the avascularity of the lesion, and perhaps the capacity of the tubercle bacillus for long survival under unfavourable conditions, all discourage the belief that any drug of this type can bring the infection under full control. There is nevertheless evidence that the dissemination and extension of acute tuberculosis in the guinea-pig can be retarded. That sulphanilamide is capable of doing this was reported more than four years ago by Rich and Follis[1]: since then a similar effect has been obtained from sulphathiazole, and an even more striking retardation by promin, a soluble derivative of 4,4′-diaminodiphenylsulphone.[2] These effects have only been achieved by dosage on a scale which could not be contemplated for clinical use, as much as 1% of the drug being incorporated in the animals' food over long periods. Guinea-pigs can apparently tolerate this treatment, but according to B. E. Hall *et al.*[3] quite moderate doses of promin frequently produce a haemolytic anaemia when given for the treatment of tuberculosis in man: recovery is fortunately rapid after withdrawal of the drug. These authors treated 70 cases, and they state neither the effect on the disease nor the actual frequency of the consequent anaemia, but it is evidently a factor which must seriously curtail the efficacy of the treatment. If long-continued systemic treatment with promin is not feasible, there remains the more limited possibility of its local application, and this has been exploited by W. H. Tytler and A. D. Lapp in a study described on p. 748. The advantage of local sulphonamide treatment is that a high concentration of the drug can be attained in the neighbourhood of the lesion itself, while that in the blood remains relatively low. In Hawking's[4] studies of the experimental prophylaxis of gas gangrene, sulphanilamide attained a concentration of about 1,000 mg. per 100 c.cm. in the wound fluid when introduced in powder form: sulphapyridine, being much less soluble, reached a concentration of only 40 mg. per 100 c.cm.; and sulphathiazole, with an intermediate degree of solubility, approached the ideal by combining adequate concentration with persistence. The solubility of promin is no less than 45%: solution and absorption would therefore be so rapid as to deprive the drug of any persistent action unless measures were taken to retard them. This difficulty was overcome by incorporating a solution in a tragacanth jelly; but an alternative worthy of trial would be the employment of 4,4′-diaminodiphenylsulphone itself, or of some other compound with a degree of solubility more suited to local use. This type of preparation seems nevertheless to have been satisfactory, and its injection into tuberculous abscess cavities was followed in some cases by remarkably rapid healing. As the authors point out, there is a large field for such treatment in tuberculous cervical adenitis. Abscesses in connexion with tuberculosis of bone were among their successful cases, and there is presumably no serious contraindication to injection into an affected joint. Although this treatment has a limited scope, it is evidently worthy of further trial, and may prove capable of improvement and extension.

NEW SOURCES OF QUININE

The question of extending cinchona cultivation in the Colonial Dependencies, and the possibility of making the Colonial Empire largely independent of outside sources of supply of quinine, both for its immediate needs and for post-war years, is under consideration by a special sub-committee of the Colonial Advisory Council on agriculture and animal health. The planting of cinchona is already being carried out on some scale in Uganda, Tanganyika, Kenya, and Ceylon. Practically the whole of the world's supplies of quinine were, before the war, derived from Java. Thence, before the Japanese occupation, the total annual exports were in the region of 1,700,000 lb. a year. The only other sources of production were India, which produced about 70,000 lb. a year, and South America, which is the original home of cinchona, and from which small amounts of bark continue to be exported. Action was taken at an early stage of the war to ensure that reserves of quinine should be available in the Colonies. Concentration of troops and labour forces in the malarial areas, however, makes increased demands likely, and steps are being taken to meet this possibility.

WANTED: BRITISH MEDICAL FILMS

As most readers know, the function of the British Council is to make people in other countries acquainted with the various aspects of British cultural life. It does this through the medium of the written and spoken word, and also through films. The British Council is now engaged in producing medical films, and is at the same time anxious to have a complete record of any medical films in this country which might be suitable for showing overseas, which are not already included in the catalogues of the British Film Institute or of Messrs. Kodak, of 16 mm. or 35 mm. gauge. Will any medical man who has such films communicate with the Film Department of the British Council at 3, Hanover Street, London, W.1?

The *Journal of the American Medical Association* announces that the A.M.A. will not hold its 94th annual session in San Francisco next June. This is the third time in the history of the Association that an annual session has been cancelled, the earlier occasions being in 1861 and 1862 during the Civil War. The House of Delegates, the Board of Trustees, and scientific councils and the officials will meet in Chicago to deal with the affairs of the Association, particularly the many wartime responsibilities being borne by the medical profession of the United States.

For some years past efforts have been made to obtain for the members of the Royal Naval sick-berth staff recognition of their qualifications, by examination and experience, to be accepted as male nurses in civil life. These attempts have hitherto failed, and neither of the two recent committees (presided over by Lord Athlone and by Lord Horder) which have dealt with nursing generally have touched on the matter, though it was specially brought to their notice. The effort continues, as may be judged from the letter by Surgeon Rear-Admiral Falconer Hall printed in the *Journal* of Nov. 21 (p. 621). It is hoped that the position of these competent and deserving men will be fully considered before any new legislation is proposed.

War Medicine Series

The paper printed below is based on a lecture which was one of a series recently given at the British Postgraduate Medical School, Hammersmith

SKIN DISEASES IN WAR

BY

R. T. BRAIN, M.D., F.R.C.P.

The various infections of the skin account for the great majority of skin diseases in war, and these infections may be considered conveniently in their aetiological groups. Thus we have the common pyogenic infections, seborrhoeic dermatitis, mycotic infections, virus infections, and those due to animal parasites. In many of these conditions the diagnosis is simple and calls for little comment, while treatment is of supreme importance not only to the individual but to the community, for the speedy cure of an infection is the most certain method of preventing its spread.

The Pyogenic Infections

The common infections to be considered under this heading are of streptococcal or staphylococcal origin, but it should be remembered that mycotic and virus lesions, and also the less familiar lesions of cutaneous diphtheria and leishmaniasis, may be pustular too.

Impetigo Contagiosa

Several clinical varieties can be recognized, the discrete scabbed sore being the most common. Bullous lesions suggest greater virulence, and the spread is usually rapid. As the bullae resolve after rupture by drying centrally, the edges remain red and may extend as a circinate lesion closely resembling tinea but more rapid in its course. Rarely, ulcerative lesions termed " ecthyma " occur, and this variety leaves scars. Occasionally pale scaly lesions—impetigo pityroides—are present with or without the other varieties, and such lesions are apt to be confused with the scaly seborrhoids, to which they are probably related. Impetigo often involves the angles of the mouth, producing septic fissures ; it also attacks the skin folds, setting up a septic intertrigo, the post-auricular variety being the most common. Septic fissures and pus-coccal intertrigo are likely to persist as chronic lesions long after the primary condition of impetigo has cleared up. Sometimes in the course of impetigo, either because the infection is very acute or the skin is irritated by treatment, a rapidly spreading pus-coccal dermatitis results. This appears as a bright erythematous area—hot, slightly oedematous, often weeping or crusted, but not indurated or so well defined as erysipelas, and the constitutional disturbance is lacking. A weeping pus-coccal dermatitis is often loosely called "eczema," but it is advantageous to retain the latter term for the response of a hypersensitive skin in which grouped minute papulo-vesicles erupt in non-inflamed areas. Naturally a skin may be sensitized by an infection or by an irritating application, and then upon the dermatitis so produced the grouped eczematous lesions will appear ; but if the eczematous nature of the new eruption is not at once apparent by its morphology it soon will be when further eczematous lesions arise outside the inflamed area and perhaps symmetrically upon the limbs. The distinction between dermatitis and eczema is of practical importance because in acute pus-coccal dermatitis the infection must be fought, whereas eczema calls for sedatives and emollients to soothe and desensitize the skin.

Before discussing treatment it is necessary to add that few dermatologists claim to be able to distinguish between staphylococcal and streptococcal lesions of impetigo contagiosa. Streptococci have often been found in pure culture in early bullous lesions, which cannot therefore be regarded as peculiar to impetigo of staphylococcal origin. The dramatic response of many cases of bullous impetigo to a sulphonamide adds support to this view.

Treatment of Impetigo

One might say provocatively that general treatment is unimportant, for most of the cases clear up quickly on local treatment alone. Even so, it is bad practice to treat any lesion and neglect the individual, and in the exceptional case general treatment is vital: this happens when a virulent organism or lack of resistance on the part of the patient produces a rapidly spreading infection, the lesions of which are deeply coloured with an erythematous flare spreading around them like a developing erysipelas. Sulphanilamide is usually quickly effective in such cases, doses of 1 g. three or four times a day for a week being adequate as a rule. Although such relatively small doses rarely produce toxic symptoms, ascorbic acid is a safeguard, and as wartime diets are low in vitamin C content, doses of 50 mg. two or three times a day are useful. Personal experience and reported cases suggest that vitamin C is very helpful in many infections, so that it is worth while giving it alone in obstinate cases of impetigo. Chronic pus-coccal lesions such as septic fissures and intertrigo may resist local treatment for years unless every effort is made to improve the general health. The good effects of ultra-violet light upon immunity and metabolism should be considered. Phenobarbitone has cured many an obstinate case of impetigo in a nervous subject whose picking at the sores, even during sleep, has frustrated local treatment.

Local treatment is determined by local conditions. The most important fact to remember is that the normal dry intact horny layer is invulnerable to bacterial infection. A moist skin is a vulnerable skin, so that the indiscriminate use of water or grease is to be avoided. The exudate from moist pus-coccal lesions can permeate the stratum corneum, thus bringing the organisms in a suitable culture medium to the moist layers, where they may actively infect ; and no doubt this explains the spread of bullous impetigo on the face by a pillow at night. This can be prevented by soaking a clean handkerchief in liq. hydrarg. perchlor., pinning it when dry to the pillow, and lightly powdering it with talc. Auto-infection by scratching can be diminished by cutting the nails short, scrubbing the free edges, and disinfecting them with antiseptic—an important fragment of technique in nervous patients and in children. Obviously it is equally important to dry up the early lesions as soon as possible. When these lesions tend to dry and heal spontaneously it is sufficient to apply calamine lotion or a dusting powder, and cure may be expected in a few days. Flat scabs on dry lesions may be left undisturbed and in due course they will flake off the healed skin, but the scabs on purulent sores need removing so that the antiseptics may inhibit or destroy the infection. A simple and satisfactory method of removing scabs and crusts is to apply hot compresses of 2% sodium sulphate for one hour and then to cleanse with a similar lotion or with 1% solution of sodium bicarbonate or normal saline. Dettol, hydrogen peroxide, or hypochlorite solution may usefully be added to the cleansing lotions. The need for isotonic or slightly hypertonic solutions is stressed, because skin denuded of its protective stratum corneum is instantly damaged by water, and the H-substance released by the disrupted cells increases the erythema and exudation. The starch poultice brings heat and moisture into more intimate contact with the skin, but it is less cleanly than the saline compress. Kaolin made into a paste with 2% sodium sulphate solution is a simple substitute for the starch compress.

Having cleaned away scabs and exudate, the next object of treatment is to dry the moist surface. Local ultra-violet light is an excellent method if available, since this has a superficial bactericidal effect and also stimulates healing and increases the resistance of the skin. Failing ultra-violet, infra-red or the near light of an electric bulb, or the warm air of an electric dryer, can be used. In actual practice one often has to depend upon powders and drying lotions. As a powder basis, zinc oxide, talc, and kaolin should be used instead of starch, and 2% of ammoniated mercury or calomel or 5% of sulphanilamide may be incorporated. Sulphanilamide powder alone is effective in the treatment of virulent lesions but more active as a 5% solution in glycerin.

In mild infections calamine lotion alone or with 2% liquor picis carbonis or 0.1% mercury perchloride is to be preferred as a cosmetic application. A suitably tinted 20% suspension of kaolin with 0.1% mercury perchloride or 2% ammoniated mercury is a useful alternative. If these lotions do not control the exudate—and occasionally metallic substances increase it—the dyes should be used. A 2% watery solution of gentian violet is excellent, although it obscures the lesion more than 0.1% acriflavine, to which 4% of tannic acid may be added to coagulate the serous discharge. Certain metallic salts also have a coagulating effect; useful formulae being silver nitrate 2 to 5% in distilled water; or eau d'Alibour, zinc sulphate gr. 6, copper sulphate gr. 4, in 1 oz. of water. Alcoholic solutions irritate the broken skin, and even spirit soap is best avoided.

If the skin becomes too dry or if eczematous lesions indicate intolerance of watery applications, creams or pastes should be tried. The former consist of 6 to 10% of calamine or of zinc oxide in a mixture of a vegetable oil and an equal volume of lime-water. Up to 10% of lanolin may be added to make a smoother cream, and the further addition of 2% of ichthammol, phenol, or liquor picis carbonis serves to relieve irritation and to add an antiseptic quality to the cream.

Zinc paste consists of one part of starch, one of zinc oxide, and two of soft paraffin. No doubt it would be just as effective if made with equal parts of kaolin and vaseline. These pastes may be improved for certain conditions by adding 2 to 3% of crude coal tar or of yellow oxide of mercury. Either may suit a dry impetigo, an obstinate intertrigo, or an eczematous lesion intolerant of lotions. Since pastes contain 50% of powder they can absorb moisture from the skin, and their degree of permeability prevents maceration and overheating. Compared with ointments, pastes represent a saving of nearly 50% of the fatty base—an important economy in war.

Ointments have a limited sphere of usefulness, and their irrational employment on moist lesions accounts for a lot of unnecessary dermatological practice. The skin is kept moist and vulnerable to infection under greasy films, and the formation of a healthy stratum corneum is retarded because desiccation is part of its natural stimulus. It is true that, according to many textbooks, ointments have a prominent place in the treatment of impetigo, ung. hydrarg. ammon. being popular in this country and the U.S.A. and diachylon ointment in some European countries. It may fairly be said that many cases of impetigo get well in spite of the use of ointments, and that with careful cleansing of the lesions before applying ointment successful results can usually be obtained, although it may entail daily visits to a clinic. The advantages of substituting lotions for ointments can readily be demonstrated. A weak mercurial ointment is useful when hard scabs form at night, especially in the scalp, and ung. hydrarg. nitratis dil. often heals septic fissures which are apt to persist at the angles of the mouth and just inside the alae nasi. Quinolor ointment and the sulphanilamide ointments are sometimes more effective than the mercurials, but they are rarely necessary in the treatment of impetigo.

Some patients are very susceptible to staphylococcal infection of the hair and sebaceous follicles, and since grease increases this susceptibility sycosis barbae may be a sequel to treating impetigo of the beard area with an irritating ointment.

Sycosis Barbae

This is essentially a chronic staphylococcal infection of the hair follicles, and the diagnosis is rarely established clinically before 3 or 4 weeks have elapsed. In sycosis barbae the infected follicles are a deep brownish-red colour and many of them have small pustules at their orifices through which the hair protrudes. Although commonly localized to the shaven area or even to the upper lip or chin, sycosis may involve the eyebrows, scalp, neck, and every hairy part of the body. If in addition to sycosis there is marginal blepharitis, and septic follicles in the nares, the prognosis is bad. This resistance to local treatment supports the view that the skin lesions are in the nature of pustular bacterides, and in consequence secondary to a focus of staphylococcal infection elsewhere. The focus should be sought in the nasal sinuses, tonsils, and teeth, for if focal sepsis is found and eradicated the prognosis is greatly improved.

The treatment of early sycosis barbae is that outlined for impetigo. Hairs should be manually epilated from purulent follicles, the superficial pustules expressed gently, the lesions cleansed with isotonic solutions and mild antiseptics, the skin dried, and a lotion or paint applied. The watery solutions of the dyes or the zinc and copper sulphate lotion should be tried first, and if the skin becomes too dry ichthyol cream is applied at night. Quinolor ointment has given excellent results in many cases of sycosis; it should be well rubbed into the affected areas night and morning or, better, alternated with a lotion by day. Watch must be kept against intolerance to a local application, or all the hair follicles will become inflamed and quickly pustular. *X*-ray therapy, in fractional or epilation doses and skilfully combined with the other local treatment, often produces a favourable turn in an obstinate case, but not infrequently all the present art of the dermatologist fails to cure the chronic case, which remains terribly vulnerable to the staphylococcus. Finally, a course of toxoid, vaccine, or preferably a mixture of both may do good; but often, although specific antibodies in circulation may be increased many-fold, the skin susceptibility to infection persists, and so does the sycosis.

Seborrhoeic Dermatitis

Seborrhoeic lesions are common and troublesome in war for reasons not difficult to understand. Whatever is the true nature of these conditions—and that remains controversial—the importance of constitutional factors is generally accepted. The subjects may be plump and placid or thin and nervous, but both types have moist greasy skins, have generally a liking for carbohydrates, and are always very prone to infections of their skins and mucous membranes. Nervous and anxiety states, limitation of protein and of protective foods, and restricted facilities for personal hygiene are the aggravating factors of war. The indications for general treatment therefore are clear, and it remains to consider the local conditions.

The indisputable seborrhoeic lesion is the pale pink macule which occurs on a scurfy scalp and tends to spread behind the ears and to the margins of the scalp, the midlines of the back and chest, and the folds and flexural surfaces. These lesions of seborrhoeic dermatitis are large confluent patches or discrete macules, circular, oval, or circinate in pattern, the latter suggestive of tinea circinata. The colour is a very pale pink as a rule; the lesions are irregularly covered with a soft, greasy, flaky scale, and irritation is slight or absent. Follicular papules topped by a small scale may be present on the greasy skin too, and acne vulgaris is common in the young seborrhoeic patient and rosacea in the middle-aged. This tendency to follicular lesions is further marked by a frequency of boils, indicating a characteristic susceptibility to staphylococci which probably accounts for many seborrhoeic lesions. The importance of the pityrosporon of Malassez, the organism predominant in scurf, remains doubtful, therefore, in spite of the fact that treatment of the scurfy scalp is the keystone of local therapy. For this purpose ointments of sulphur, salicylic acid, or resorcin are used to soften and remove the scales, the process being completed by a shampoo, using a 2% solution of sodium bicarbonate and a tablet of sulphur or carbolic soap. Spirit soap is very effective, but is more likely to irritate an inflamed scalp. A liniment of 5% salicylic acid in 1 part of spirit and 7 parts of castor oil, a cream of 2% ichthammol in lotio calaminae oleosa, and a lotion of 2% precipitated sulphur in calamine lotion are very useful for seborrhoeic lesions of the scalp and skin, while many of the remedies and methods used in the treatment of impetigo can be advantageously employed.

Mycotic Infections

The epidermophyton infections are by far the most common variety in war, and, since the feet are the usual sites involved, early diagnosis and effective treatment are essential. The former is usually simple, for an erosive dermatitis spreads from the toe clefts to the sole of the foot, with a circinate advancing edge of itching pustules or vesicles. The horny layer, separated by exudation, breaks and peels off, leaving moist red tender areas. Distant groups of tense vesicles may arise in the middle of the sole, and sometimes the infection begins here. A scraping of the under surface of a vesicle mounted in 10% sodium hydroxide may reveal the fungus and confirm the diagnosis of tinea pedis.

Unfortunately, epidermophytoxin readily sensitizes the skin so that deep vesicles erupt on the soles and also on the palms, and in these vesicles no fungus can be demonstrated; nor do the lesions respond to fungicides, but usually they do resolve when the primary mycotic infection is cured. These allergic eruptions, called "epidermophytids," are clinically indistinguishable from the eczematous conditions of podo- and cheiro-pompholyx, which, like other types of eczema, clear up and tend to recur without any obvious external cause. Tinea relapses because of residual infection, often apparent in the fourth toe cleft as thick white cuticle, speckled at the sites of small vesicles. Eczematous lesions must not be treated with strong antiseptics or fungicides; hence the importance of recognizing them so that general and local sedative measures may be employed.

Pyogenic intertrigo of the toe clefts is often confused with tinea, but the septic process is more acute, the surface moist at the sites of ruptured bullae, and as a rule the infection spreads to the more delicate dorsal surfaces of the toes. Scabies may be the cause of vesicles and pustules on the feet, and from the infected lesions an extending pyogenic dermatitis sometimes resembles tinea. More rarely, pustular psoriasis or acrodermatitis perstans has to be distinguished from tinea, for in these conditions, clinically identical, groups of pustules erupt in the middle of the soles. These pustules are generally set in dry shiny red plaques suggestive of psoriasis; the contents are usually sterile, and treatment with fungicides is ineffective.

Epidermophyton infection of the groin—tinea cruris—is either secondary to tinea pedis or is acquired from infected lavatory seats or clothing and towels. As in the case of scabies and pediculosis pubis, tinea cruris may be a venereal contagion. The disease begins as small scaly pink macules, resolving in the centre and spreading centrifugally with a scaly edge so that by the time advice is sought the lesions are already circinate and the diagnosis rarely in doubt. Monilia infections are so similar that they are diagnosed as tinea; but this does not matter, because they respond to the same treatment. On the other hand, intertrigo when mistaken for ringworm is likely to be irritated by treatment with fungicides, and indeed this common lesion of the groin may be a sequel to the treatment of tinea cruris.

Intertrigo begins in the depth of a fold, as a bright erythematous patch, fading towards the edges—in contrast with the ringworm lesion. The friction of coarse woollen clothing on a moist skin often produces intertrigo of the inner sides of the thighs near or adjacent to the scrotum, and because of this location a diagnosis of tinea is apt to be made. Either of these lesions may be found in the axillae too.

Treatment of Epidermophyton Infections

The crural and axillary lesions will clear up in a week or two if treated efficiently, and a simple method is to use Whitfield's ointment—ung. acid. benzoic. co., *B.P.C.*—a little well rubbed in at night, and, after cleansing with soap and water in the morning, to apply a mild antiseptic lotion. The dilute mercurial ointments will also cure early infections, and when necessary the fungicidal effect can be enhanced by adding 4% of chrysarobin or 0.5% of derobin or cignolin. The sole use of such ointments will cure many cases of tinea cruris; but there is less chance of producing a dermatitis and the skin is more comfortable if kept dry with a lotion by day. Underclothing must be disinfected. Tinea pedis should be treated on similar lines. The strong ointments are well tolerated, and 4% of tannic acid in acriflavine lotion is useful to control hyperidrosis. Relapses are common because the fungus is protected from therapeutic agents by the thick horny layer of the sole, which is often greatly hypertrophied at the sites of infection. The trichophyton is even more inaccessible, if it reaches the nail folds or under the nail-plate, where it may give rise to onychomycosis. So after an apparent cure it is important to prescribe a spirit paint for use after washing the feet. A suitable one is 0.2% of mercury perchloride and 2% of salicylic acid in surgical spirit; this should be painted around the nails and in the toe clefts for at least six months. Its use on the soles of the feet would be a good prophylactic measure. Socks must be disinfected and the insides of boots treated with formalin.

Trichophyton infections, and occasionally microsporon infections, account for tinea circinata, the common ringworm of the glabrous skin. Diagnosis is easy as a rule, and the treatment is that given for tinea cruris. The pustular ringworms give more trouble, and tinea barbae is not infrequently confused with sycosis barbae. Ringworm of the beard area presents an indurated granulomatous swelling studded with pustules. These may show a circinate pattern and thus give a clue to the diagnosis, which may be confirmed with some difficulty by pulling a hair out of a pustule and mounting it, and the pus with it, in 10% sodium hydroxide. Fungus or spores may be seen with the 1/6-in. objective under restricted illumination. The usual treatment of tinea can be applied to tinea barbae, but the hairs should be epilated from the pustular follicles. Hot compresses of 5% sodium thiosulphate or of 10% lotio calcii sulphurati are often helpful. Large doses of sodium iodide should be tried in deep and obstinate mycotic infection.

Virus Infections

Herpes simplex most commonly occurs on the face, where it is often mistaken for impetigo. The sudden eruption of grouped vesicles on an inflamed base with preceding irritation is the clue to the diagnosis. Penile herpes is not uncommon, and must be distinguished from scabies and primary syphilis.

Zoster presents similar herpetic lesions, and when seen late in a confluent pustular stage the resemblance to impetigo is close. The sharply unilateral distribution and the rapid evolution of the full eruption establish the diagnosis, and a history of preceding pain or hyperaesthesia completes the clinical picture. If pain is severe hypodermic injections of 1 c.cm. of pituitrin, or sodium iodide in doses of 15 to 20 gr. t.i.d., may give relief. Herpetic lesions of both types are best treated with 1% phenol in calamine lotion.

Warts may be just unsightly or, owing to their situation, may be the cause of disability. In either case they are a virus infection, and so are likely to spread on the individual or to infect others. Treatment, especially of the solitary wart, is a much-neglected but important fragment of preventive medicine. When warts are few in number their complete removal or destruction should be attempted. Curettage with a sharp spoon and subsequent sterilization of the crater with pure phenol is often satisfactory. Cauterization by heat or with CO_2 snow has the advantage of leaving a dry surface, and after diathermy or galvano-cautery no dressing is required. These methods appear to be radical and certain, but they are not, for the virus may be distributed more widely than the lesion indicates, and under the stimulus of the virus the interpapillary processes of the epidermis thrust deeply into the corium. The epidermal cells carry the virus with them, so that a single surviving cell presumably can account for a recurrence of the wart. Fortunately many warts disappear if they become involved in an inflammatory reaction, however slight, and this probably accounts for the successful use of *x*-ray therapy and of ionization, although considerable evidence exists of a favourable response to suggestion, which is inseparable from impressive techniques. When warts are numerous caustic paints should be used; but it is essential to pare away the thick horny cap continually, because it is resistant to most of the preparations that may safely be entrusted to the patient. Salicylic acid is a safe and effective keratolytic, and a 10% solution in collodion or spirit forms the basis of many paints for warts.

Painting is more effective if the wart is kept covered by adhesive plaster, and a resistant plantar wart may respond to this method if painted every other day with liquid phenol or 80% trichloracetic acid in water. After several paintings the thick horny cap often comes away adhering to the plaster, leaving a deep crater, which should be again painted with phenol and dressed with ung. acid. salicyl. A pencil of CO_2 snow firmly pressed on a plantar wart for several minutes until a narrow zone of normal skin around the wart is frozen will be followed by a bullous reaction which permits the wart to be dissected away with ease in a day or two. The crater should be dressed as above. Large plantar warts may be treated with x rays, and success can be expected in about 80% of cases. The treatment is painless, but an x-ray burn is not, and must be avoided by careful dosage. A previously untreated wart may be given a single dose of 600 to 800 r units through 1 mm. of aluminium at a kilovoltage of 90 to 120. Pain is usually relieved quickly, and the plantar wart should disappear in a month; if it does not, the dose may be repeated, but once only. A more cautious method is to give four doses of 200 r at weekly intervals exactly to the wart. Should irradiation fail it is important to avoid the use of strong caustics and cauterization, but the irradiated wart can safely be pared and kept under plaster. Ung. acid. salicyl. *B.P.* may be applied within a protective ring of felt.

Diseases due to Animal Parasites

Scabies.—The diagnosis of this common and troublesome disease may be easy and certain if typical burrows are present, or it may be so difficult as to baffle the most experienced dermatologist. Burrows should be sought in the creases of the wrist, of the ulnar side of the hand, and of the palm. It is not generally known how easily the acarus or ova can be demonstrated by wetting the burrow with 5% solution of caustic soda or potash and then scraping out with a scalpel and examining the scraping under the low power of a microscope. Even if burrows are not found, an itching eruption of fine papules on the wrists, the inner sides of the arms, the axillary folds, the umbilical region, the pubic area, the inner sides of the thighs, and the ankles is almost certainly scabies, and a history of familial cases increases the probability. It should be remembered that a patient with factitious urticaria will produce urticarial lesions by scratching scabies, and in children papular urticaria is often vesicular or bullous; so is scabies, and both may show the same distribution. Lesions in the finger clefts are misleading, since cheiropompholyx, eczema, and intertrigo imitate scabies there.

Treatment of Scabies.—When many treatments are advocated to cure a disease it usually means that none of them is satisfactory, but surely the exception to this aphorism is in the case of scabies. The present spate of new methods merely emphasizes the probability that any insecticide brought into intimate contact with every bit of infected skin will cure the infection. There are three essentials to success in the treatment of scabies. First, an attack upon the stratum corneum, which shields the parasite from the insecticide and indeed provides a veritable Anderson shelter for the acari on the palms and soles. Thorough scrubbing with a nail-brush and lots of soap on several occasions is usually necessary, although the use of strongly alkaline or soapy solutions, which themselves soften and penetrate the horny layer, gives a fair measure of success without the scrubbing. But the easy way is not the best. Secondly, every part of the body must be treated with the insecticide, and it is obvious that the chance of missing small areas decreases with repeated applications. To prevent dermatitis venenata arising from treatment, a limit, determined by experience with each remedy, must be set to the number of these applications. The third essential is the disinfection of the underclothing and night apparel. Recent experiments have made doubtful the necessity for sterilizing the outer garments and bedding, but where facilities exist the extra precaution can do nothing but good. Contacts must be treated or reinfection is likely to occur.

The choice of an insecticide is dependent upon what is available, and due consideration should be given to economy. The derris root treatment described by Captain Saunders (*British Medical Journal,* 1941, **1,** 624) is clean, simple, and economical; briefly, it consists of six applications in two days of the following lotion. One teaspoonful of soap flakes to 10 oz. of a mixture of 4 oz. of derris root powder in one gallon of cold water. The lotion of equal parts of benzyl benzoate, industrial methylated spirit, and soft soap has become very popular, and the official cream is less irritating and more acceptable to the patient. After soaping, scrubbing, and bathing the benzyl benzoate lotion is painted on the wet skin and again when dry, and any residual lotion should be used up next day on the areas most involved and on the thick skin of the palms and soles. Sulphur is an excellent insecticide and is more potent in an alkaline medium. The effective but messy ointment need not be used. There are many new emulsifying bases which make non-greasy ointments and creams to which 10% precipitated sulphur may be added. For example, 7% of lanette wax added to a simple ointment enables the product to be creamed with water. Good results have been obtained with lotio calcii sulphurati diluted 1 in 10; with 10% sodium thiosulphate followed by the application of dilute hydrochloric acid; and also with precipitated sulphur rubbed into soap lather and then into the skin. When sulphur is not tolerated 10% balsam of Peru in zinc ointment will be found useful.

The reaction of the skin to these remedies is mainly follicular, and the appearance of a rash of irritating red dots marking the irritated follicles is often regarded by the patient as an extension of the scabies, so that treatment is continued and extensive dermatitis results. This should be treated with calamine lotion, to which 2% of tar solution may be added. Luminal, gr. 1/2 b.d., helps to allay the irritation of the dermatitis or the psychic itch which lingers with imaginative folk long after the infection is cured.

Pediculosis

Pediculi are often the cause of irritation of the scalp, body, and pubic area, and it is surprising how often their presence is overlooked.

Nits or pediculi in the scalp are a simple explanation of local irritation and of scratch marks across the shoulders. A lotion of phenol 3% in liq. hydrarg. perchlor. should be applied liberally to the scalp, where it will kill the lice and prevent or cure septic infection. The same lotion will allay the irritation of the scratched skin.

Pediculi corporis should be looked for when a patient has soiled underwear, especially if by habit or necessity the clothing is worn night and day. Infested patients complain of irritation of the body, and excoriations and pigmented macules are often seen. The lice are to be found concealed in the seams of the underclothing, although in severe infestation they are present on the skin too. Various insecticide powders for dusting on the clothing provide a second-best method for the control of body lice, but the obvious solution is the improvement of personal hygiene and efficient disinfection of clothing and bedding.

The crab louse, *Phthirius pubis,* gives rise to an intense pruritus of the pubic area. The infection is often a venereal one, but it may readily be acquired from infected lavatory seats. Inspection of the pubic hairs, preferably with the aid of a magnifying glass, reveals the presence of the small dark nits close to the skin. It is not so well known that *Phthirius pubis* also attacks the axillae and eyelid margins. Treatment is simple, and the phenol lotion mentioned for the treatment of pediculosis capitis will do for the pubic and axillary areas. The weak sulphur and mercurial ointments are also effective, but strong applications must be avoided. For example, ung. hydrarg. has been responsible for much dermatitis and discomfort. So has the unnecessary habit of shaving the pubic area. The liberal use of soap lather is very helpful, and no doubt a paste of it with precipitated sulphur would be an excellent remedy. The ova are less readily destroyed, but if treatments are repeated at intervals of a few days the infection is soon ended. Disinfection of the underclothing is necessary.

A plan for the abolition of coal smoke from our towns and cities within ten years from the end of the war is outlined in the autumn number of *Smokeless Air,* the journal of the National Smoke Abatement Society (temporary address: 94, Manor Green Road, Epsom, Surrey). The proposed scheme (published for discussion and not yet officially adopted by the society) is based on proposals already made for the creation of smokeless central and other special zones as a part of post-war town planning, and suggests that in each town there should be a planned stage-by-stage extension of these zones until the whole town is smokeless. The rate of progress, especially when residential areas are reached, would depend primarily upon the rate at which increased supplies of smokeless fuels and appliances become available.

HOSPITAL SERVICES AND CONTRIBUTORY SCHEMES

At the distribution meeting of King Edward's Hospital Fund for London, held on Dec. 15, the DUKE OF GLOUCESTER took the chair for the first time as President in succession to the late Duke of Kent. In his address to the Council he said that to-day there was very general agreement that whatever arrangements were made for the future of the hospital service there were features of the voluntary system which were precious and must be preserved. On the recommendation of the Distribution Committee it was proposed to distribute £280,000. The general financial position of the hospitals was better than might have been expected; the grants made by the Ministry of Health for the costs of the casualty service had helped in many cases; but a number of hospitals were finding some difficulty in meeting their expenditure. Sir EDWARD PEACOCK, in making his financial statement, said that one of the most difficult new factors to be kept in mind was the demand for capital expenditure that would confront the hospitals after the war. The King's Fund had to do its best to adjust the delicate balance between the immediate needs of the hospitals and the post-war requirements. Sir ERNEST POOLEY presented the report of the Distribution Committee with the schedule of grants recommended to hospitals and convalescent homes.

Minister of Health's Statement

Mr. ERNEST BROWN, in proposing a vote of thanks to the President, expressed his keen interest in the work of the Fund, particularly in its function as a sort of centralized bureau for promoting high standards of service among the London voluntary hospitals, and in its will to collaborate with the great municipal hospital services in the same area. The practical field work of bodies like the Fund assumed enhanced importance now, at a moment when ideas on reconstruction in the hospital and health services were being quickened, and in a country where the conception of building out of, and on to, existing practical experience was inherent in reform. The moment was particularly notable from that point of view, because of the issue of that extremely interesting, constructive, and (in the right sense) provocative contribution to the reconstruction theme—the Beveridge Report. That report was receiving a thorough review in the light of the much wider problem of reorganizing the background of individual living, which all were determined to solve. With reference to "Assumption B" in the report—"Comprehensive health and rehabilitation services for prevention and cure of disease and restoration of capacity for work, available to all members of the community"—the Minister recalled that in Oct., 1941, he had announced in the House of Commons that it was the Government's intention to secure, by means of a comprehensive hospital service, that appropriate treatment was available for all who needed it; also that it was intended to maintain the principle that, in general, patients should be called upon to make a reasonable payment towards the cost, through contributory schemes or otherwise. The Minister continued:

> "On this last point the Beveridge Report recognizes that the question of patients' contributions and of contributory schemes is one which can be decided only in relation to the whole problem of the organization of hospital services, and one which will depend on the general policy found best for providing those services. While it is too early yet for me to determine the shape of that policy (I am now conducting all the preliminary spade-work and shall later be consulting the interests most concerned) no one can be more alive than I to the value of the practical work done in the past, and being done now, by the various contributory schemes; and also to their potentialities for the future—particularly if they are able to converge a little more on to more uniform paths—for example, in matters of their rates of payment to hospitals and in their readiness to extend those payments equally to any hospital, wherever situated, to which the medical needs of a patient make it desirable to send him. You have, I know, been putting a good deal of useful effort into the questions of contributory schemes in London and the better correlation of their activities. You would, I feel, be well advised to go ahead with this—perhaps particularly on the two aspects which I have just instanced—and your progress will certainly be of interest to us in considering the part which it may be found best to expect these schemes to play in any long-term hospital policy."

STATUS OF THE GENERAL SURGEON

A Manifesto from South Africa

A copy of a manifesto has been received from the Group of General Surgeons of the Johannesburg General Hospital. This body, which was set up on March 9, 1942, comprises the four honorary senior surgeons on the staff of the hospital and their first and second assistants, who are also on the honorary staff. The senior member of the surgical staff, Mr. I. W. Brebner, who is also Professor of Surgery in the University of the Witwatersrand, was unanimously elected chairman. The reasons for the formation of the group are set out as follows, and the honorary secretary states that suggestions and criticisms from readers who are interested or concerned will be welcomed.

The Johannesburg Hospital Manifesto

In centres of medical activity throughout the world, the position of the general surgeon has for long been a source of perturbation. The impression has been allowed to become prevalent that general surgery as a specialty is rapidly becoming defunct. This is not the feeling of general surgeons themselves.

The Group of General Surgeons of the Johannesburg General Hospital feels that it is expressing the views of general surgeons everywhere when it states that whatever may be the advantages of narrow fields of specialism, there are also disadvantages. There is apt to be a somewhat confined outlook and lack of broad perspective in small specialties. The one system concerned in any particular specialty is, after all, but a small part of the body as a whole, and its diseases are often considered without due regard to the whole organism. The present-day tendency to embark on specialism soon after qualifying never permits such specialists to appreciate the immense importance of the condition of the rest of the body in relation to their own small sections of it In the teaching of students particularly the preceptor must be able to consider the whole body in relation to disease and injury and not merely a part of it.

The aims of the Group of General Surgeons are:

1. To maintain the status of the specialty of general surgery.
2. To promote the exchange of ideas between the members of the Group by the reading of papers and the showing of cases.
3. To encourage the individual general surgeon to develop a particular bent within the range of general surgery.
4. To promote closer relationships between the various specialist groups.

Finally the scope of the general surgeon is defined by the Group thus: "A general surgeon is entitled to perform that work that he and his general surgical colleagues consider he is competent to undertake."

MEDICAL DEFENCE UNION

The annual meeting of the Medical Defence Union was held under the chairmanship of Dr. James Fenton, who, during the proceedings, was elected President for 1942-3. Mr. E. D. D. Davis was re-elected Treasurer, and Dr. G. Roche Lynch was elected Chairman of the Council Committee.

Dr. Fenton referred with regret to the death of Dr. G. de Bec Turtle, which took place only a few weeks after his election as President 12 months ago. The Union, he said, had now a membership of 25,000, the highest figure, he believed, obtained by any organization of medical practitioners which restricted its activities to the British Isles. The war had not diminished litigation, and the Union was to-day spending a much larger proportion of its annual income on the defence of members than it had done in years gone by. It was well to remind doctors in general that the State and military authorities did not, except in special cases, accept responsibility for real or alleged acts or omissions of their medical officers when engaged in medical practice as members of H.M. Forces. As a rule a medical officer was required to defend the results of his own work when charged by a litigant; moreover, he might require legal protection even against the authority by whom he was employed, and might even need legal representation before a court martial. The President drew attention to the need for special care in certification; the Union had been called to defend before the courts and professional tribunals medical practitioners who had been charged with wrongful certification. It was difficult to find any justification in some of these cases, but the Union had done what it could to save members from penalties.

Correspondence

Shortage of Beds in Fever Hospitals

Sir,—Many fever hospitals have a proportion of their beds diverted for general hospital purposes; most of them are experiencing acute difficulty in recruiting and retaining an adequate nursing staff; many, particularly in "danger areas," are unable to use their all-glass isolation units. It is becoming increasingly difficult to cope with demands for beds, and it is in the hope that practitioners will co-operate by refraining from recommending hospitalization, except where this is really necessary, that I send you this note. I fully appreciate that war conditions make home nursing difficult, but I hope that practitioners and the public will realize in their turn the peculiar difficulties of the hospitals. If parents, officers in charge of camps and billets, and others involved can be assured that infectivity diminishes rapidly in most diseases after the typical rash has appeared, that susceptible contacts have therefore already been infected, that late hospitalization will do little to prevent local spread, that the risk of the conveyance of infection by healthy third parties is negligible, they will be more willing to keep the clinically mild case at home or in billet. German measles, chicken-pox, and other minor infections can only be admitted at the expense of pertussis, enteritis, and other illnesses of actual and potential seriousness. It is particularly in London, where the hospital authority has been in normal times perhaps over-altruistic in agreeing to admit non-notifiable infections, that the pressure is severe. Any help that family doctors and others can give will be much appreciated by those responsible for fever hospitals.—I am, etc.,

Andrew Topping,
President, Fever Group,
Society of Medical Officers of Health

Treatment in Psychiatry

Sir,—Recent correspondence on the subject of shock treatment in psychiatry appears to have done something to resurrect insulin therapy from the partial eclipse it has recently undergone by the advent of electric convulsion therapy. This eclipse must be partly accounted for by the quick and dramatic results that have been obtained in many cases by the latter method. Before being carried away by the virtues of either method we must admit that there are sound reasons for believing that there is a place for both in treatment, and that the ideal mental hospital should have both at its disposal. What is needed is a more careful choosing of cases for one or the other treatment. It is becoming generally recognized that certain of the melancholias, particularly of the involutional type, yield good and sometimes dramatic results with convulsion therapy. Convulsion therapy has proved disappointing in the treatment of dementia praecox, on the whole, and it may be claimed that the majority of these cases do best on insulin therapy. In those in whom depression or stupor are marked, good results are obtained by combined insulin and convulsion therapy, a point which has not been stressed by your correspondents. Time is precious in the treatment of schizophrenia, and many valuable weeks are often lost by the use of prolonged convulsions. In this connexion it is true in general that if some improvement does not occur after the first two or three convulsions it is best to proceed straight to insulin therapy.

Yet, despite the acknowledged value of insulin, its use has diminished since the war began. This may be attributed to the difficulties of obtaining sufficient sugar, and to the reduction of mental hospital staff. We have recently shown (Sandison and McGregor, *J. ment. Sci.*, July, 1942, p. 387) that the use of the intravenous insulin treatment avoids the wartime problem of sugar. By shortening the time of daily treatment and its freedom from complications it enables the nursing and medical staffs to do more work in other departments. In more than one mental hospital this technique is now being used with success.

Dr. William Sargant (Nov. 28, p. 648) brings statistics to his aid in support of insulin. However true his deductions may be, statistics must be treated with caution in psychiatry. The diagnosis of early schizophrenia is notoriously difficult, and many so-called remissions occur in patients who were probably depressives or even psychoneurotics.

In conclusion, convulsion therapy fails to give such good results in many centres because of the lack of prolonged personal supervision which is inherent in insulin therapy and so valuable to the schizophrenic. I should like to sum up with a plea for the introduction of both forms of treatment in every centre, the wider use of combined therapy, and for greater nursing supervision of those undergoing convulsion therapy. Insulin should be given by the intravenous technique.—I am, etc.,

R. A. Sandison,
Flying Officer, R.A.F.

Child Health

Sir,—With reference to the letters of Dr. J. Burnet (Nov. 21, p. 616) and Dr. Eva McCall (Dec. 12, p. 708) I desire to state that we doctors in the health services have an outlook toward disease that may be somewhat different from that of our colleagues who are specialists in treatment. It appears to us that there is a great waste of talent and ability on repairing bodies damaged by disease due to causes which, figuratively speaking, issue from conduits the taps of which might be turned off, and on treating established maladies rather than finding and checking them in their beginnings as slight disorders of function.

We would therefore ask our colleagues in high places to join with us and with research workers through some suitable organization (like that of the health centres proposed in a State Medical Service) to attack disease in a resolute and rational manner, provided, of course, it isn't the seeking for profits but human welfare—a more worthy object for a great profession. (Fuller details of what is meant will be found in a résumé of an address given by me to the Derbyshire Branch of the B.M.A. in June, 1938, and published in the *Journal*, Jan. 8, 1939, p. 45.) Those who are disposed to adopt this view might be interested in the Child Health Planning Group Movement, for details of which I refer readers to the general secretary, Dr. Kershaw, Medical Officer of Health, Accrington, Lancashire.—I am, etc.,

Glossop. E. H. M. Milligan.

The Dysentery Carrier

Sir,—In his letter (Nov. 21) Dr. Ian Taylor refers to dysentery: its notification in peacetime and wartime, and the marked upward tendency during the last years. For good reasons Dr. Taylor explains the greater frequency partly by the improved means of bacteriological investigation; it is indeed a remarkable advance which has been achieved by the research work of the last years. Again, the discoveries of Leifson, Hynes, and the workers in the E.P.H.L. Service have resulted in the use of new and very effective culture media for growing the causative agents of bacillary dysentery. But in spite of these remarkable advances there remains still a disproportion between clinical evidence and laboratory confirmation. Before and at the outbreak of the last war, when the difficulties in obtaining exact results from faecal cultures were so pronounced, we had in the early diagnosis of bacillary dysentery to look for other means of help. In my studies on procto-sigmoidoscopy I (1906) emphasized the value of ocular inspection in this respect, and advocated (*Med. Klin.*, 1914, **44**) that this method should be made obligatory. In obtaining material for bacteriological examination directly from the affected parts through the endoscope positive results rose to as much as 60 and 100%.

The insidious and tenacious character of dysentery may be recognized by the fact that often in apparently healthy patients with normal motions the speculum discloses still active ulcers in the lower intestine; this proves that the endoscopic examination is not only a great help to diagnose the beginning of the disease but also to ascertain that the patient is really cured. By omitting this control we risk missing carriers who without any knowledge of their condition become a permanent danger to the community. This is but one aspect of the matter of detecting and controlling carriers. There are other sides to this problem, such as the controversial question where the germs are lodged in chronic infections—in the liver, in the intestinal wall, or in both. The prophylaxis of chronic and endemic forms of bacillary dysentery includes still the question under which symptoms insinuating or attenuated infections become manifest.

In my view some of the cases of so-called "idiopathic" ulcerative colitis are originally caused by germs of bacillary dysentery.

I completely agree with Dr. Taylor that scrupulous hygiene is a strict necessity, but in conformity with this there are still some unsolved questions or matters under discussion which we hope will be fully explained with the help of recent researches.—I am, etc.,

Sanderstead, Surrey
GUSTAV SINGER, M.D.,
Emeritus Professor of Vienna University

Sulphonamides for Gonorrhoea

SIR,—Apropos the correspondence on sulphonamides for gonorrhoea, it is worth while drawing attention to an investigation made by Towsky *et al.* (*J. Lab. clin. Med.*, 1942, **27**, 1001) in which sulphapyridine, sulphathiazole, and sulphadiazine are compared. The cure rates were (excluding defaulters) 92%, 96%, and 93% respectively, between which there is no significant difference. The rates for defaulters, however, are: for sulphapyridine 28.8%, for sulphathiazole 9%, and for sulphadiazine 3.5%; if the defaulters are counted as failures the cure rates then become 65.5%, 87%, and 89.5% respectively. Toxic reactions were: sulphapyridine 75%, sulphathiazole 11.5%, and sulphadiazine 8.8%. To effect a cure the average dose required was for sulphapyridine 23.5 g. in 8 days, for sulphathiazole 28 g. in 8 days, and for sulphadiazine 17.5 g. in 8 days. The authors conclude that sulphapyridine "would better not be used in the treatment of gonorrhoea in the ambulatory patient," and that "it would seem that sulphadiazine is a valuable drug in the treatment of gonorrhoeal urethritis."

Recent experience in this hospital emphasizes the value of sulphadiazine in various acute infections, such as a severe staphylococcal septicaemia uninfluenced by a week's treatment with sulphathiazole but responding immediately to sulphadiazine. It is unfortunate that there is difficulty at times in obtaining this drug. There appear to be good reasons why sulphanilamide and sulphapyridine should no longer be used when the newer drugs are available.—I am, etc.,

Pathological Department,
Royal Infirmary, Bradford
C. J. YOUNG.

SIR,—Col. L. W. Harrison (Dec. 5, p. 677) has interpreted my remarks wrongly. I did not question his statement that in the great majority of men who present themselves for treatment within 4 days after coitus sulphathiazole eradicates the disease within a few days—the length of treatment required apparently depending on the virulence of the causative organism. I am convinced of this from my own very limited experience. But what I am querying is the necessity for using expensive, and to some extent dangerous, drugs in very early cases, when the same result can be achieved by simple irrigation.

Gonorrhoea is caused by the deposition of gonococci in the mouth of the urethra. The diplococci lie deposited on the surface for 2 or 3 days before causing any visible signs of inflammation or discharge. If immediately after intercourse a man micturates and bathes the penis and particularly the mouth of the urethra with hot water and soap, he washes off all gonococci and escapes infection. (The above is especially true if he inuncts himself before and after intercourse with 33% ung. hydrarg. subchlor.) After the lapse of a few hours syringing the anterior part of the urethra with weak permanganate solution is enough. Later on, up to the 4th day, injection (t.i.d.) of 20% argyrol, which is retained in the urethra with forcipressure for 10 to 15 minutes, is enough. When this period is over and gonococci have penetrated into the deeper layers of the mucous membrane, when the desquamation of that membrane—as indicated by the flow of thick pus—is going apace, and the inflammation is rapidly advancing along the whole length of the urethra (taking about 7 days to spread to the prostate), no antiseptic that we know of can penetrate the necrotic mucous membrane, and we have to rely either on the establishment of natural immunity (as in olden days), which takes on an average 10 weeks, or on the administration of sulphathiazole, which effects a cure in these advanced cases in 2 or 3 weeks—not 2 or 3 days.

Sulphathiazole and sulphapyridine are wonderful remedies, but why employ them in very early cases when simpler methods are equally useful, less expensive, and less dangerous?

Since writing my note (*Journal*, Nov. 21, p. 617) I have consulted the latest edition (1941) of the *Extra Pharmacopoeia*, and there in vol. i on p. 946 I find Col. Harrison's earlier advice (not to use sulphonamides for 3 weeks) given in full as a warning to intending users of this group of drugs in early cases. Certainly it is advisable for authorities like Col. Harrison—to whom humbler practitioners like myself look for advice and guidance—to issue a public recantation of their earlier views whenever such views undergo a revolutionary change.—I am, etc.,

Manchester

Service Cases of Venereal Disease on Demobilization

SIR,—With reference to the letter from Drs. David Erskine and V. E. Lloyd (Nov. 21, p. 617) on the need for the prevention of temporary or permanent default from treatment in Service patients discharged from the Army after the armistice, may I make additional suggestions.

I suggest that *all* members of the Services and the Civil Defence organizations should undergo a Wassermann and a Kahn test before discharge to civil life. There are three main reasons for this suggestion. First, there are bound to be syphilitic infections that have escaped the notice of both the medical officer and the patient. Secondly, it will save a great deal of annoyance and expense when wound pensions come to be granted, both in the immediate post-war period and later; and, finally, it gives us the golden opportunity of doing mass blood tests on the great majority of that portion of the population on whom the country will depend in the difficult years to come. This could prevent some of them becoming those patients with tertiary syphilis who are never even aware that they are diseased, and who will eventually become a liability rather than an asset to the community. Those found to be infected could then be warned of their condition, and told of the need for treatment. Obviously, only a small proportion of these cases would go to a treatment centre, public opinion and ignorance of V.D. being what it is. It is up to us to start a widespread fearless and informative publicity campaign immediately, so that public opinion will not prevent these people from seeking treatment when they are demobilized.

Only if we make the most of this opportunity shall we be able to prevent the increased incidence of congenital and tertiary cases later on, as well as the epidemic of early syphilis which Drs. Erskine and Lloyd have warned us will follow demobilization of specific cases who do not continue treatment.—I am, etc.,

PHILIP SILVER.

Stilboestrol and Deep X Rays for Sarcomatous Metastases

SIR,—Prompted by your annotation in this week's issue (Nov. 28, p. 641) on the use of stilboestrol in the treatment of cancer of the prostate, I am sending you the following account of a case which is, I think, noteworthy, inasmuch as a large metastatic deposit from an osteogenic sarcoma of pleomorphic cell type has almost entirely disappeared following a course of deep *x*-ray therapy combined with the injection of stilboestrol in comparatively large doses.

The patient was 18 years old when first seen at this centre on March 4, 1941. She had a tumour of the upper end of the tibia, showing irregular absorption and sclerosis of bone. An intensive course of deep *x*-ray treatment was given to the tumour but no response occurred, apart from relief of pain, and radiographs showed that bone destruction was continuing. Consequently the leg was amputated at the junction of the middle and lower thirds of the femur on Oct. 21, 1941. Healing occurred without incident and all looked well until June, 1942, when she was found to have a lump in the groin, 6 cm. in diameter. Deep *x*-ray treatment was given to this metastasis in July, and, as in the case of the primary growth, no response took place and the mass began to ulcerate in August. As a last resort it was decided to try the insertion of radium needles, but before this could be done serious haemorrhage began from involvement of the femoral vessels or their branches. Consequently the external iliac artery was ligated on Sept. 14.

From consideration of the known properties of stilboestrol, its actions and molecular structure, I decided to try the effect of administering it in conjunction with deep *x*-ray treatment.

The result has been striking. The huge fungating tumour has gradually disappeared, leaving a remarkably clean cavity, in parts of the walls of which a small amount of tumour tissue is still present, and the process of healing is continuing. The ulcer, which was at one time 8.5 cm. in diameter, has decreased to 3.5 cm. × 5 cm. Another extraordinary feature of the case is the sharp definition of a metastatic deposit in the lungs. A curious pyrexia has been observed. After an initial fall, the temperature rose gradually to a maximum of 101° F. and then fell again, equally gradually, the whole cycle of pyrexia extending over a fortnight.

The initial dose of stilboestrol was 5 mg. intramuscularly daily for one week, increased to 7½ mg. daily for twelve days, when, owing to the development of the pyrexia, it was discontinued. After a fortnight the stilboestrol was recommenced, 10 mg. being given intramuscularly daily for 22 doses. The *x*-ray treatment given to the metastatic deposit was 200% S.E.D. in 17 days at the surface of the tumour, the depth dose at the deeper parts being 85%. The patient's general condition has improved recently; the temperature has fallen to normal and she is putting on weight.

The points of special interest are: (1) The primary growth is an osteogenic sarcoma and the pathological examination shows it to be a spindle-celled growth but with marked pleomorphism of the cells. (2) The primary growth did not respond to irradiation, as shown by repeated *x*-ray films. (3) The metastatic deposit also did not respond to *x*-ray treatment until this was combined with stilboestrol injections.

I am treating another patient, who has an osteochondrosarcoma of the femur with recurrence in the stump, in a similar way, and although the effect is not so striking I think some slowing down of the rate of growth of the tumour has taken place. I am loath to publish reports of cases which may be premature and where sufficient time has not elapsed nor a sufficient number of cases treated to establish the value of any treatment with certainty, but deep *x*-ray work has come to a complete standstill at this centre on account of lack of supplies, and there may be no possibility of my resuming the investigation for some considerable time. As will be seen, the amount of *x*-ray treatment is below the maximum tolerance dose, and it may be that the metastatic growth in the lungs might be equally responsive to treatment.

In view of the fact that the workers mentioned in your annotation have used stilboestrol alone I may be permitted to add that I think the regression in my case was due to the combined effect of irradiation and stilboestrol, and the effect may not be specific, and may well apply to other radio-resistant tumours.—I am, etc.,

Regional Radium Centre, North Staffordshire Royal Infirmary. GEORGE G. BINNIE.

Phosphorus Poisoning from Bullet

SIR,—It was with great interest that I read of the case of Mr. A. J. Blaxland (Dec. 5, p. 664), as I had a similar case a short time ago.

This was an engine driver, aged 55, who was machine-gunned and wounded by a 'plane returning from the Canterbury raid. He had a perforating wound of the abdomen, the point of entry being just above the left anterior superior spine. *X*-ray examination showed a part of the bullet casing high up in the abdominal cavity. On exploring the wound it was immediately noticed that the whole track was smoking profusely when exposed to the air. A white vapour, which was extremely irritating to the nose and eyes, issued from all the damaged tissue. The bullet casing was found in the cavity of the stomach, having penetrated the transverse colon and the greater curvature. All the smoking tissue was excised and the wounds of the intestine and stomach were closed. The abdominal cavity was swabbed out; sulphonamide powder was applied and the wound in the abdominal wall was closed, drainage being effected by a suprapubic tube. The post-operative condition was satisfactory. He was given intravenous plasma followed by glucose and saline. He made good progress at first, but soon began to develop a severe toxaemia with anuria. Coma supervened, and he died on the fifth day after operation. At no time during this period was there any suggestion of peritonitis. He had no vomiting and his bowel action was normal.

At the time I felt the patient had succumbed to some toxic process which in all probability was phosphorus poisoning. Unfortunately a post-mortem examination was not possible.—I am, etc.,

Folkestone. J. W. D. BUTTERY.

Saline Laxatives in Dysentery, etc.

SIR,—I hope Col. Hamilton Fairley, who will recall making much use of my pathological slides after the last war, may be interested in the comment that his remark (Dec. 5, p. 673) "magnesium sulphate treatment should not be continued over too long a period, as it sometimes tended to keep up the diarrhoea" suggests that the dosage of magnesium sulphate has been too small. It always seems a paradox that sodium and magnesium sulphates should be used in the treatment of dysentery, and the paradox is increased by the fact that formed stools are frequently passed even while large doses are being given. I have frequently had to order other laxatives when patients were taking 1 oz. or more of magnesium and sodium sulphate in the 24 hours, and have even seen crystals—presumably of magnesium sulphate—sparkling in the motion.

The fact seems to be that the intestinal canal can quickly accommodate itself to high concentrations of cathartic salines—witness the man who for years took 2 oz. of solid magnesium sulphate every morning—and the curative effect of salines in dysentery is probably to be attributed to this power. This property, if judiciously used, enables us to apply what is, in effect, continuous hypertonic saline treatment to the ulcerated areas, which presumably, like other ulcers, do not have this power of adaptation. At the start of treatment there is the usual cathartic flush of fluid, which sweeps away the tenacious mucus that is largely responsible for the pain and tenesmus, and it will do this for both types of dysentery. The amoebic ulcers, however, will not heal because of the amoebae deep in the mucosa, but continuing with a sufficient dosage of salines will usually lead to healing of the bacillary type, just as hypertonic saline leads to healing of other infective ulcers.

While this view is largely theoretical, though supported by reading and experience, it has a bearing on two clinical problems of first-class importance. If it is correct a similar saline treatment should be effectve in typhoid fever. If applied early enough it should lead to healing of the ulcers before formation of the sloughs, it should certainly check the profound toxaemia, and, incidentally, allow food to be taken without harm. Unfortunately, I had left the Near East before this idea occurred to me, so I could not make any clinical observations on the matter, but I feel sure it is well worth trying. The other clinical application I would suggest is that it ought to be possible to apply hypertonic treatment to gastric and duodenal ulcers also. Here, however, there is no real need to have a hypertonic solution of an unabsorbable substance, as we must if we wish to treat the lower bowel. Frequent doses of fairly concentrated glucose would seem to be an attractive method of treatment. Sugar is an old and also effective treatment for ulcers, and probably acts largely on the hypertonic principle. Glucose would afford the gastric ulcer case much-needed nourishment, and the thirst which would probably ensue could be relieved by ice and rectal salines. Probably other foodstuffs could soon be taken along with the glucose without much, if any, danger.—I am, etc.,

Winsford, Cheshire W. N. LEAK.

Teaching First Aid

SIR,—May I be allowed heartily to endorse Dr. E. W. Adams's plea (Dec. 12, p. 707) for a common textbook for the teaching of first aid. The very fact that the differences in the two books of the St. John Ambulance Brigade and the Red Cross are nearly all in matters of detail makes it all the more difficult to remember them, and that same fact should make it easy for the societies, with a little mutual good will, to evolve a common textbook. They might at the same time take their courage in their hands, cut out some of the elaborate methods, and teach real emergency practical first aid: such quick and efficient ways have come to light under recent stress. For example, when the 8-bandage method for fractured femur was evolved the importance of treating the patient rather than concentrating only on the lesion, with the consequent increase in shock, had not been realized. It is also rather typical that three methods of treating fractured clavicle are given in the Red Cross manual with a rather apologetic note that the third method is the best; why not put the best method first and cut out or at least refer shortly to the other two? The treatment of fractured jaw, again, is, in most surgeons' opinion, not only out of date but dangerous. I refer to the bandage pulling the jaw backwards. It is worse than silly that we should be expected to teach such things for examination purposes.

I speak as a teacher of first aid from both manuals of over 25 years' experience.—I am, etc.,

Chippenham GEO. LAURENCE.

Blood Pressures after Injection of K Salts

SIR,—In the course of some work on stimulants of the autonomic nervous system we have repeated as faithfully as possible Dr. Lena Stern's treatment for shock as described in the *Journal* of Nov. 7 (p. 538). We chose three psychotic patients who were not shocked and had no marked disturbance of the vegetative nervous system; thus the results may not be comparable but are still of interest. Eleven cisternal punctures were performed on the three patients—five on one, four on a second, and two on the third. We obtained a definite primary rise in blood pressure on one occasion only, from 160/85 to a maximum of 240/105 in four minutes by the injection of the potassium phosphate made up to the strength and pH described and kept in neutral glass. The pulse rate fell from 92 to 50 in the same time, though the beat was stronger than beforehand. Our complete results on the blood pressures and pulse rates were as follows:

Case 1

	Time(min)	0	3	8	11	13	15	18	20	26

B	B.P. ..	125/70	135/75	140/85	120/80
	Pulse ..	76	88	76	—

Among the other changes observed when the solution was injected under "definite pressure" were sweating, nystagmus, headache, vomiting, and on one occasion hiccup. It appears that the treatment must be undertaken with considerable caution in view of the fact that there may be indications of medullary shock. It is of note that the respirations altered very little, even when the other symptoms were pronounced.—We are, etc.,

JOHN A. AINSLIE.
Netherne Hospital, Coulsdon E. CUNNINGHAM DAX.

Scientific Journals for Enemy Prisoners of War

SIR,—In response to letters in the *New Statesman and Nation* (July 18, 1942), *Nature* (Oct. 3, 1942), and the *British Medical Journal* (Oct. 17, 1942), 58 people have so far sent 2,170 reprints and journals and 34 books on academic and technical subjects for the use of scientists and medical men who are enemy prisoners of war in British hands. Nearly all the papers have been classified according to subject. The special interests of prisoners at the various camps are known, and parcels containing 956 papers and journals have already been sent to 32 camps. So far only a small part of the demand has been met.

Those who are willing to contribute reprints, journals, or books on scientific, technological, medical, or mathematical subjects are asked: (1) to address parcels to me at the address given below; (2) to write their own names and addresses on the *outside* of their parcels with the letters "S.P.P." (which stands for "scientific papers for prisoners"); (3) to use plenty of packing paper if it is available (a lot is needed in repacking parcels according to the needs of the various camps, and all will eventually be salvaged); and (4) to be patient in waiting for acknowledgments of parcels sent (as the classification, packing, and correspondence are done by my wife and myself in such time as is not occupied with work and civil defence).

The S.P.P. organization, which has the approval of all the authorities concerned with the welfare of enemy prisoners of war, works through Mr. J. W. Barwick of the War Prisoners' Aid section of the Y.M.C.A.—I am, etc.,

Burnt Oak, Kidlington, JOHN R. BAKER.
Nr. Oxford

Obituary

The death took place at York on Nov. 10 of Dr. ELISABETH SARAH MARPLES SYKES, for some years assistant medical officer and radiologist at the West Riding Mental Hospital, Wadsley, near Sheffield, and afterwards at Storthes Hall, near Huddersfield. She was the youngest daughter of the late Rev. W. Sykes of Sheffield, and Dr. Annie Dodgson Rayner of Bournemouth is her sister. Dr. Elisabeth Sykes studied medicine at Sheffield and graduated M.B., Ch.B. of the University in 1925; before entering the mental hospital service she held the post of extra-mural assistant honorary physician to the Royal Hospital, Sheffield. She joined the British Medical Association in 1927 and was a member of the Royal Medico-Psychological Association and the Medical Women's Federation.

Dr. IVOR LLOYD TUCKETT of Cowes, Isle of Wight, died on Nov. 28. He was born in London on Feb. 1, 1873, the son of Philip D. Tuckett, and after eight years at Marlborough College went up to Trinity College, Cambridge, and then to University College Hospital. He qualified M.R.C.S., L.R.C.P. in 1898 and returned to Cambridge to become senior demonstrator of physiology and assistant to the Downing Professor of Medicine. He was elected a Fellow of Trinity, and proceeded M.D. in 1910. Before leaving London he had been house-physician at U.C.H., and his interest in ophthalmology began while house-surgeon at Moorfields. He joined the B.M.A. in 1912, was chairman of the Isle of Wight Division, and president of the Southern Branch in 1937-8. F. C. E. writes: By the death of Ivor Lloyd Tuckett we are bereaved of an outstanding personality and intellect. His researches on the functions of the pancreas in diabetes—starting on the trail which afterwards led Banting to insulin—made us all expect for him a career of brilliant fruitfulness. But, alas! he had driven himself too hard, and a nervous breakdown compelled him to limit himself to ophthalmic practice in the Isle of Wight. He was greatly interested in psychology and submitted himself to analysis. Always a fearless crusader after truth, he published in 1911 a book, *Evidences for the Supernatural,* in which his skilful pen and critical insight usefully exposed a great deal of nonsense and humbug. This reappeared later in a cheap edition. An inheritor of modest wealth, his chief pleasure was in sharing its amenities with others and in generously helping the less fortunate. Cruising and racing in small yachts was his principal hobby, and he won several of the coveted trophies at Cowes. There will be many, like myself, who mourn the irreplaceable loss of a wonderful friend with a delightful sense of humour all his own.

Dr. JOHN PERCIVAL BROWN of Bacup, Lancs., died on Nov. 30. Born at Bacup in 1878, he was educated at Manchester Grammar School and Victoria University, Manchester, graduating M.B., Ch.B.Vict. in 1900. After holding resident posts in Manchester and Macclesfield, he joined his father, the late Dr. John Brown, in general practice. The remainder of his life was devoted exclusively to service in his native town, until failing health compelled him to cease work twelve months ago. In 1913 he succeeded his father as M.O.H. for Bacup, a position which, between them, they held for fifty-four years. He was a member of the B.M.A. for over forty years. Dr. Brown was a corps surgeon in the St. John Ambulance Brigade, and was actively interested in the movement since the formation of the local divisions about fifty years ago. In 1926 he was appointed an Officer of the Order of St. John. During the last war he did valuable Red Cross work. Throughout his life Dr. Brown was keenly interested in historical medicine and legal medicine, and he rarely missed a meeting of the Manchester Medico-Legal Society, of which he was a member. He is survived by his wife, two daughters, and a son, Surg. Lieut. Douglas J. A. Brown, R.N.

We regret to announce the death at the age of 51 of Dr. MELVILLE ST. CLAIR HAMILTON of Tiverton. He was the youngest of three brothers, all of whom followed their father in the medical profession, and at the outbreak of the last war he was studying at St. Thomas's Hospital. After qualifying M.R.C.S., L.R.C.P. in 1916 he was accepted for a regular commission in the R.A.M.C., serving in France, and later in Italy and Turkey, also with the Army of Occupation and with the Expeditionary Force at Archangel. In 1923 he resigned his commission through ill-health, but after long treatment was able to resume work and practised in North Wales until he joined his brother, Dr. A. Keith Hamilton, at Tiverton, where he showed keen and practical interest in many local organizations. During the present war he acted as M.O. to the 20th Devon Battalion of the Home Guard, and undertook the task of organization and instruction with characteristic thoroughness.

We regret to record the death of Dr. JOHN ORLANDO SUMMERHAYES of Newhaven after an operation in London. Born at Ealing on Feb. 7, 1869, the son of William Summerhayes, M.D., he was educated at Yarmouth Grammar School and St. Mary's Hospital, qualifying as M.R.C.S., L.R.C.P. in 1891. In 1898, after holding several appointments, he went out to India as surgeon-in-charge of the C.M.S. Hospital at Quetta, returning eight years later to practise at Thame. Summerhayes had a distinguished record in the Territorial Force: he had been medical officer to the 1/4 Oxford and Bucks Light Infantry and went out to France as lieut.-col. R.A.M.C.(T.F.) commanding a field ambulance and won the D.S.O. for gallantry and devotion to duty. Soon after the war he was in charge of a special military mission to prisoners of war in Austria, Hungary, Czechoslovakia, and Silesia. After returning to civil life at Thame he served as chairman of the Oxford Division of the B.M.A. in 1923-4, and president of the Oxford and Reading Branch in the following year. He then moved to Newhaven, where he built up a large practice and became police surgeon and medical officer to the local infirmary. He was elected to the East Sussex Insurance and Panel Committees and had served as chairman of the former since 1934. His colleagues of the Brighton Division of the B.M.A. elected him their chairman in 1932. At headquarters in Tavistock Square he had been a member of the General Medical Services Scheme Committee and of the Naval and Military Committee.

The death is announced from Moscow of Prof. MAXIM KONCHALOVSKY, president of the All-Union and Moscow Therapeutic Association and of the All-Union Association for the Study of Rheumatism, and also vice-president of the International League for Combating Rheumatism. Prof. Konchalovsky took part in international congresses in Paris, Brussels, Budapest, and Moscow, and was a leading member of the Scientific Medical Council of the People's Commissariat for Health Protection of the U.S.S.R. He published some 200 works, including textbooks, monographs, and scientific articles.

The following well-known medical men have died abroad: Prof HEINRICH FINKELSTEIN, at Santiago, Chile, the eminent Berlin paediatrist, author of a work on diseases of infants, and honorary Fellow of the Royal Society of Medicine, aged 76; Dr. MANUEL CORACHAN, professor and director of the Institute of Experimental Surgery at the University of Caracas and author of works on gastric surgery, arthropathy, and arteriography, aged 62; Dr. GEORGE W. HALL, clinical professor of neurology at Rush Medical College, Chicago, from 1925 till his death, aged 72; and Dr. ALFRED S. TAYLOR, professor in operative surgery at the College of Physicians and Surgeons, New York, aged 73.

The Services

DEATHS IN THE SERVICES

We much regret to announce the death at the ripe age of 85 of Lieut.-Col. DIROM GREY CRAWFORD, the historian of the Indian Medical Service. He was born in 1857, during the Indian Mutiny, at Chinsura in Bengal, took his medical degree at Edinburgh University in 1881, and gained a high place in the entry for the Indian Medical Service the same year. After the necessary short and uneventful period in military employ, he joined the Bengal Medical Department in 1884 and remained in that Province for the rest of his service, mostly as civil surgeon of the Hugli District, a little north of Calcutta and near his birthplace. In 1903 he published *A Brief History of the Hugli District* and the *Hugli Medical Gazetteer.* He was a sound civil surgeon with a special aptitude for administrative work, and it was unfortunate that he had to retire under the age rules without attaining to administrative rank. During the war of 1914-18 he served at home in hospital ships, was mentioned in dispatches, and was awarded a star and two medals—the only recognition he appears to have received during his long service. Crawford's great occupation in life was historical medical research. His interest in the subject was aroused as early as 1884, when he was resident surgeon at the Calcutta Medical College Hospital, by an article on "Surgeons in India, Past and Present," by Norman Chevers, who was himself the author of the classical *Commentary on Diseases of India.* Crawford began to collect further names, and in time added some 250 to the old list, which covered seventy-four years. He never ceased work at it until the publication in 1930 of his monumental *Roll of the Indian Medical Service 1615–1930.* In 1901 he began another great task by undertaking, at the request of the then editor of the *Indian Medical Gazette,* Major W. J. Buchanan, I.M.S., to write a yearly article entitled "Notes on the History of the I.M.S." In 1914 these chapters, with considerable additions, were published in two handsome volumes as a *History of the Indian Medical Service.* This comprehensive work goes back to the surgeons of the sixteenth century who visited India, and it was only rendered possible by Crawford devoting much of his leave home to studies of the dusty records at the India Office with an assiduity given to few to emulate. All this work eminently qualified him to write accurate and terse obituary articles on his brother officers for the *British Medical Journal* for over twenty-five years, a labour of love in which he can never be equalled. Crawford was a man of the most modest and retiring nature and, although his erudition was universally admired, he had few intimate friends. Those who knew him best had the highest opinion of his good qualities, and some thought that his classical education, wide knowledge, and remarkable powers of application would have found greater scope in the Indian Civil Service; but his brother officers of the I.M.S. are proud to regard him as one of their most erudite members. Although extremely modest as regards his own achievements he was quick to notice and encourage scientific and other work by younger members of his Service. Another of his interests was the collection of all books, medical and non-medical, published by I.M.S. officers. A few years ago he gave this unique and valuable collection to the Royal

Society of Tropical Medicine and Hygiene, in whose library they are preserved together in a separate bookcase for future reference. Crawford never fully recovered from the shock of the loss of his wife only a few years ago, and although he continued to attend the annual I.M.S. dinners up to the time of their cessation during the present war, his health and his sight were observed to be failing. It can truly be said that we shall never see his equal again in the field he made for himself, but he so completely fulfilled his self-allotted medico-historical task that he has left nothing for a successor to do, except it be to write the obituary notice of the Indian Medical Service with the approaching abrogation of British rule in India, not the least of the benefits of which rule has been the work of the I.M.S., of which Crawford was an ornament.

Surg. Cmdr. Elystan Glodrydd Evelyn O'Leary, R.N. (ret.), died at Newtonmore, Inverness-shire, on Nov. 8. He took the M.R.C.S., L.R.C.P. in 1894 and the F.R.C.S.Ed. in 1907. Entering the Royal Navy soon afterwards, he attained the rank of surg. cmdr. in 1912, and retired nearly 20 years ago. He served throughout the war of 1914–18, receiving the medals.

Col. Robert Reginald Heber Moore, C.B.E., late R.A.M.C., died at Cheltenham on Sept. 27, aged 84. He was born at Liverpool on April 8, 1858, son of the Rev. Canon Thomas Moore of Midleton College, Co. Cork, and was educated at Trinity College, Dublin, where he graduated M.D., B.Ch. in 1890, having qualified L.M., L.Ch. in 1881. Entering the Army in 1883, he became lieut.-col. after twenty years' service, and retired in 1912. He rejoined for service during the war of 1914-18, when he was employed as D.A.D.M.S., Eastern Command, and was given a brevet colonelcy in 1917. He was appointed a C.B.E. in 1919.

Lieut.-Col. Frederick George Faichnie, R.A.M.C. (ret.), died in London on Oct. 30. He was born in India on May 30, 1870, was educated at University College, London, and took the M R.C.S., L.R.C.P. in 1890. He entered the Army in 1892, became major in 1903, and retired in 1912. He served on the North-West Frontier of India in 1897-8 (medal with clasp) and throughout the South African War of 1899-1902, when he took part in the relief of Ladysmith, including the actions of Spion Kop, Tugela Heights, Vaalkranz, also in operations in the Orange River Colony, Transvaal, Cape Colony, and Natal, including Laing's Nek. He was twice mentioned in dispatches and received the Queen's medal with five clasps and the King's medal with two clasps During the war of 1914-18 he was recalled for duty and served as assistant officer in charge of R.A.M.C. records, with the rank of lieut.-col. He was a brother of the late Col. N. Faichnie, R A.M.C., and leaves a widow.

Major-General Alexander William Montgomery, C.B., I.M.S. (ret.), died suddenly on Dec. 2. He was born on April 4, 1881, and studied medicine at the University of Edinburgh, graduating M.B., Ch.B. in 1902. In the following year he entered the I.M.S. as lieutenant, was promoted captain in 1906, major in 1915, lieut.-colonel in 1923, brevet colonel in 1926, substantive colonel in 1932, and major-general in 1935. General Montgomery was Honorary Surgeon to the King 1933-7, and was awarded the Companionship of the Bath (Military Division) at the time of his retirement from the I.M.S. His last appointment in India was that of D.D.M.S.

Col. Cecil Charles Murison, I.M.S. (ret.), died at Wrington, Somerset, on Sept. 20, aged 68. He was born on Jan. 2, 1874, and was educated at the Edinburgh extramural school, taking the Scottish triple qualification in 1898. Later he took the certificate of the Royal Medico-Psychological Association, the D.P.H. of the Edinburgh Colleges in 1909, and the D.T.M. Liverpool and the F.R.C.S.Ed. in 1910. Entering the I.M.S. in 1900, he became lieut.-col. in 1910, col. in 1917, and retired in 1931. He served in East Africa, in Somaliland, in 1903-4 (medal with clasp); in the war of 1914-18, in France and Belgium, 1914-15, in Egypt, 1916, and in Iraq, 1916; on the North-West Frontier of India in 1917-21, in the Maksud campaign, 1917, and the Marri expedition, 1918; and was mentioned in dispatches in 1918. Later he served in India as A.D.M.S. and for a time as D.D.M.S. in the Eastern Command, India. He had been a member of the B M.A. for 42 years.

Col. James Fuller-Good, I.M.S.(ret.), died at Fleet, Hants, on Oct. 27, aged 68. He was born on Oct 14, 1874, was educated at Queen's College, Cork, and graduated M.B., B.Ch., B.A.O. of the Royal University of Ireland in 1899. He entered the I.M.S. in 1900, became col. in 1928, and retired in 1931. He served in the war of 1914-18 and was mentioned in dispatches in 1916. For some years he was superintendent of the medical school at Rangoon and, as A.D.M.S., served in Waziristan. He had been a member of the B.M.A. since 1901.

Lieut.-Col. Albert Coleman, I.M.S. (ret.), died at Grenoble on Oct. 2. He was born on Dec. 20, 1862, and was educated at the University of Edinburgh, where he graduated M.B., C.M. in 1887. Entering the I.M.S. in 1887, he became lieut.-col. after twenty years' service, and retired in 1921. He served in Burma in 1887 (medal and clasp); in the Chin Lushai campaign of 1890 (clasp); and in the Manipur campaign of 1891 (clasp). He was appointed to civil employ in the Punjab in 1893 and spent the rest of his service in that Province, except that he reverted to military duty from Feb., 1916, to April, 1917.

Lieut.-Col. Charles Ross Pearce, I.M.S. (ret.), died at Bath on Nov. 19. He was born on June 24, 1868, the son of Stephen Pearce, artist, and was educated at the University of Edinburgh, where he graduated M.B., C.M. in 1892. He entered the I.M.S. in 1894, became lieut.-col. after 20 years' service, and retired in 1922. He was a member of the B.M.A. for 20 years.

Universities and Colleges

UNIVERSITY OF MANCHESTER

The following candidates have been approved at the examinations indicated:

Final M.B, Ch.B.—Shirley G Barrett (Mrs Ashton), S Falk, A. I Goodman, S. Grace, R. Greenwood, H. Lempert, J Whewell. *Part I*: J R Archibald, H L. Brisk, J Hinchliffe, S B. Rampling

UNIVERSITY OF DUBLIN

The Board of Trinity College, Dublin, has invited Prof. J. M O'Connor, M D., professor of physiology in University College, Dublin, to deliver the John Mallet Purser Lecture in 1943

ROYAL COLLEGE OF SURGEONS OF ENGLAND

At an ordinary meeting of the Council held on December 10, with Sir Alfred Webb-Johnson, President, in the chair, it was decided that the voting papers for the 1943 Council election be sent by air mail to Fellows over-seas whose address is recorded at the College

The Hallett Prize was not awarded on this occasion.

Diplomas of Fellowship were granted to the following candidates: R. A. Piachaud, N. F. Kirkman, S. C. Mehta, R. Roaf, J. P Bentley, B. N. Brooke, W. Thompson, D. K. Sambrook, J. P. Childs, H A Haxton, D. K. Lennox. A diploma of Membership was granted to G. H. V. Clarke.

Diplomas in Anaesthetics were granted jointly with the Royal College of Physicians of London to the following candidates:

E. H. Ainslie, Evelyn J Attkins, L B. Bourne, A Christie, P. J De Vescovi, J. Elliott, G A Hart, J A. G. Horton, Brenda G Hutchinson, I. R Jones, H G Kahlenberg, Isabelle G. Little, Florence M McClelland, Margaret McClelland, T F Miles, Dorothy S Price, E. N Price, Shila G Ransom, Alice C. Rose, J B. Scarr, T Sim, A D H. Simpson, Dorothy Spence-Sales, R J. Stout, C G Townsend, J T Worsfold, Jean R Young

Medical Notes in Parliament

Venereal Disease and Regulation 33B

In the House of Lords on December 8 Lord Winster asked the Government what was their policy in relation to venereal disease. He said he understood that there had been already complaints from the American and Canadian Service chiefs, especially about London, and the matter was therefore of particular urgency to-day. We had a duty to those countries in this respect, and Regulation 33B showed that we were trying to do something.

Viscount Dawson of Penn said that in the 10 years before the war there was a satisfactory decrease in venereal disease, but since the war began there had been a reversal in the trend, and we were now in about the same position as in 1932. There had been an increase of 70% in the number of cases. The increases were chiefly in the ports. In 7 ports, comparing 1939 and 1941, there had been a rise in the figures from 942 to 1,909. There had been a steady increase in the treatments given to civilian women—45.9% in the case of syphilis and 29.3% in the case of gonorrhoea. That led to the reflection that we were not dealing with the same problem as our forefathers were, even in the last war. The women open to contract these diseases belonged to more classes than they used to do. The professional class, who gained their livelihood and must of necessity be promiscuous, were relatively decreasing. There was a second class, the so-called amateur, who got her own living, but who was irresponsible in temperament, and set out to get pleasure from the men who attracted her, and profited by the amusements they gave her. In some respects this was the most dangerous class of all. A third class, which must not be altogether ignored, was that of girls of good repute who, no doubt, would in future become mothers, and who set up friendly relations which embraced sex relations. There was, he thought, an increasing number of venereal infections arising in these circumstances.

Treatment as an Infectious Disease

Lord Dawson said he could not see how this illness could logically or sensibly be treated except under the Public Health Acts, in the same way as other infectious diseases. If that system could be applied to such diseases as typhoid why should it not be applied in the case of venereal disease? There were two sets of difficulties to be met. The first was in regard to notifications. Up to now, venereal diseases had not been notifiable, but that was purely a matter of tactics and expediency. He thought that people would be more frightened and more anxious lest they should be discovered. That was the opinion of most health authorities. The question of treatment was different. Apart from those who were afflicted and went to the clinic and carried out treatment, there was an irresponsible residue of persons—they were not vicious, they were feckless and lived for the day; in other words, they had the faults that brought them to grief—who would be responsible for multiple infections. That hard core of irresponsibles must be dealt with.

In his judgment Regulation 33B had been most carefully thought out and was the best in the circumstances. It was no longer an offence, as in the last war, to have intercourse with the opposite sex if one were infected, but it was an offence not to go for treatment, which was a purely personal question. There was this protection, that if the doctor as the head of the clinic got to know of the woman concerned from his men, and if suspicion fell on one or two women from more than one source, then the doctor would report this woman secretly to the medical officer of health, and it would be for the medical officer of health to take steps, with the permission of a justice or a court of summary jurisdiction, to secure compulsory treatment. He could not think that anything serious was likely to occur in such cases, and at any rate what might occur would be better than letting people spread disease in an irresponsible way.

Preserving Secrecy

Dealing with the matter of preserving secrecy, and preserving the belief of people in secrecy, Lord Dawson said that that was one of his reasons for hesitating before compelling notification. He was afraid the effect on the ordinary layman's mind would be to make him think that notification would mean publicity. Since secrecy was promised some years ago in connexion with venereal disease, he believed there had been three occasions on which it had been thrust aside in a court of justice. It was worth while to consider soberly the general question of medical privilege which was here involved.

He thought Regulation 33B was a good advance, and was right and wise. It was a step from which they could go still further if necessary. He agreed that we required more centres, but the House should remember that the country was suffering from a very grave depletion of the medical profession at present—a far greater depletion than was ever anticipated when the war began. Efforts had been directed to increasing the numbers of these centres, but it was obvious that in wartime that could not be done so expeditiously as in time of peace. He was, however, quite confident that the best that could be done was being done.

Lord **Atkin** said he sympathized with the criticism of Lord Dawson about the compulsion on doctors in courts of law to disclose the treatment of a patient for venereal disease. To his mind, medical privilege, in circumstances of this kind, was a national necessity because people would avoid going to doctors if they knew that a doctor could be compelled in a court of law to disclose the information in his possession. He saw every reason for protecting the doctor in regard to communications in that respect.

Objections to the Regulation

Lord **Snell** said the Government's policy was based on the principles laid down by the Royal Commission of 1913-16. That policy had reduced the incidence of the disease, but it had risen again during the war. The problem was increasing in gravity—but the measures to meet it were also growing. At present there were 249 clinics in Great Britain where free and confidential treatment was given. Eighteen of these had been opened since the war began; 5 were now being prepared and would shortly be opened; and there had been started a new scheme for rural areas providing for free treatment under special practitioners in the latter's own surgeries. There were 109 of these special practitioners serving 74 areas in 11 counties. Special attention was also being given to the Merchant Service at ports, because these men represented a very special need.

Regulation 33B had given rise to some controversy. There were two separate views in this matter. There were those who said the provisions of the Regulation were too weak and that it was bound to be ineffective because it did not go far enough. They pointed to the experience of Sweden, which had had compulsory notification for the last 25 years and which had a lower rate of incidence than we had. The view of the Ministry of Health was that this lower rate of incidence might not be the result of compulsion. Sweden had a population of 6,500,000—less than that of Greater London. Its population was scattered mostly over rural areas, and the country had a very highly developed sense of communal responsibility. Then there were those who opposed compulsion in any form. The argument was that women would be mainly subject to its operation and not men; that they would be deterred from undergoing early treatment since they would wait for compulsion to be applied; that a false sense of security would be created among those who indulged in promiscuous sexual intercourse because fear of infection acted as a deterrent; that the Regulation relied on an "informer" for its operation; and that an innocent person had no redress if thoughtlessly accused.

Compulsion under the Regulation extended only to a group of persons, small in number but responsible for much harm, who were impervious to methods of education and persuasion, and refused to attend voluntarily. He thought that the anxiety as to a false sense of security rested on a false idea about the clearance certificate itself. A doctor would be unlikely to issue this certificate until he was medically satisfied that it was safe to the community to do so. Then the certificate was not kept by the contact but was sent at once to the medical officer of health. There were heavy penalties for false information. The special practitioners must be satisfied that the information was medically likely to be accurate, and the medical officer of health must also be satisfied before he took action.

Referring to the suggested need for clinics to attract women for treatment, Lord Snell said the Ministry believed that this suggestion was based largely on an exaggeration of the unwillingness of women to attend existing centres. Of the 199 treatment centres in England and Wales, about 75% were part of the out-patient departments of hospitals, where all kinds of conditions as well as venereal disease were treated, and were not labelled as venereal disease centres. Experience also suggested that it was the adequacy of the premises and of the treatment given rather than the labels attached to them that had most influence on attendance by women.

Reservation of Medical Students

During the third reading of the National Service Bill Mr. **Maxton** asked what would be the machinery for deciding which young men were to be admitted into the medical profession. Previously they themselves had decided. Mr. **McCorquodale** said students of medicine would be provisionally accepted by the medical schools. Then it would depend on the result of the Higher Certificate Examination the First M.B., or the appropriate examination, whether the reservation would be finally confirmed. Therefore the medical schools would have the choosing of the students. Scientific students would be recommended for deferment by the Universities Joint Recruiting Boards. Arts courses at the universities would close down at the end of the summer of 1943 except for those boys who were medically unfit for service.

Medical Supplies and Services for Europe

Lord **Cranborne**, in the House of Lords on Dec. 9, replying to a debate on relief measures for Europe as soon as subjugated States were freed from Nazi control, said provisional estimates had been received from all the Allied Governments of their requirements of food during the first 18 months after the war. Most Allied countries had also submitted lists of their medical requirements. An advisory committee in regard to medical supplies had been set up under the chairmanship of Dr. Melville MacKenzie of the Ministry of Health. This medical subcommittee was working on the preparation of a minimum list of the most essential medical supplies and was considering the organization of medical services generally. A further expert subcommittee under Dr. Penrose of the United States Embassy was to advise on the nutritional aspects of food requirements. Steps must be taken beforehand to avert the risk of famine and the greater risk of pestilences bred of malnutrition. It was essential that there should be full co-operation with the Russian Government on these questions. Plans were being made on the assumption that some rationing control must continue for a period after the war. Preparations were being made.

No. 48

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended Dec, 5.

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for: (a) England and Wales (London included). (b) London (administrative county). (c) Scotland. (d) Eire. (e) Northern Ireland.

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for: (a) The 126 great towns in England and Wales (including London). (b) London (administrative county) (c) The 16 principal towns in Scotland. (d) The 13 principal towns in Eire. (e) The 10 principal towns in Northern Ireland.

A dash — denotes no cases; a blank space denotes disease not notifiable or no return available.

Disease	1942					1941 (Corresponding Week)

* Includes primary form for England and Wales, London (administrative county), and Northern Ireland.

† Includes paratyphoid A and B for Northern Ireland.

‡ Owing to evacuation schemes and other movements of population, birth and death rates for Northern Ireland are no longer available.

§ Figures incomplete for England and Wales.

EPIDEMIOLOGICAL NOTES

Discussion of Table

In *England and Wales* the notifications of scarlet fever and whooping-cough dropped by 70 and 68 respectively; the incidence of these diseases had been mounting steadily in the preceding weeks. Further large rises were reported in the incidence of measles, 556 cases, and acute pneumonia, 124 cases. The notifications of diphtheria, down by 140 in the preceding week, have now risen by 150.

Notifications of both scarlet fever and whooping-cough in Lancashire were, respectively, 105 and 43 fewer than in the previous week. There were 36 more cases of scarlet fever in Staffordshire and 76 more in Yorks West Riding.

The only substantial increases in diphtheria notifications occurred in Lancashire, 49, and in Wales, 36.

In contrast to the general trend the incidence of measles fell in Wales and Lancashire by 130 and 90 cases respectively. The largest increases were recorded in Durham 147, Yorks West Riding 118, London 108, Derbyshire 84, Warwickshire 71, Staffordshire 59, Gloucestershire 57, Surrey 56.

The cases of dysentery numbered 191, or 28 more than in the preceding week. There was a fresh outbreak of 13 cases in Herefordshire, Leominster and Wigmore R.D. There were increases in Kent from 2 to 18, in Essex from 6 to 15; and in Suffolk a new outbreak of 15 occurred. In the first two counties the cases were spread over several administrative areas; in the last county all the cases were reported from Clare U.D. There were 7 more cases in the outbreak in Derbyshire which began last week with 26 cases. In Yorks North Riding 10 further cases were notified (Middlesbrough C.B. 8). The same totals as in the preceding week were reported from London 14, Surrey 18, and Lancashire 32. The principal centres of infection during the week in these counties were Surrey, Banstead U.D. 15, and Lancashire, Liverpool C.B. 23.

In *Scotland* the large rise of 67 in the notifications of measles was the outstanding feature of the week's returns. The total for the two burghs in Fife rose from 95 to 143, and the three burghs of Renfrew from 69 to 121. In the Dundee outbreak there were 106 notifications, or 33 fewer. A case of small-pox has been reported from Lochaber, Inverness-shire.

In *Eire* poliomyelitis is back to the high level of the past three months; 18 cases were reported, or 13 more than in the preceding week: they were scattered over fourteen districts.

Quarterly Returns of the Registrar-General for Scotland

For the September quarter the birth rate was 17.9 per 1,000, and, with one exception, was the highest recorded for any third quarter during the past ten years. The infant mortality was 59 per 1,000 live births, or 4 below that for the corresponding quarter of 1941 and the same as the average of the five preceding years. Stillbirths were 36 per 1,000, and the lowest rate recorded since registration of stillbirths was instituted in 1939. The general death rate of 10.9 per 1,000 was the lowest for any quarter since the outbreak of war and 0.2 below the five-years average. The death rate from the principal epidemic diseases was 14 per 100,000, and the lowest on record for Scotland with the single exception of the third quarter of 1939, which was 13. The average death rate from epidemic diseases for the third quarter is 21. Six deaths from small-pox, the first since 1930, when there were 2, were registered during this quarter. The death rate from all forms of tuberculosis was 70 per 100,000 and that from respiratory tuberculosis 52. The former rate was 2 below that of the corresponding quarter of 1941 and the latter was the same; they were respectively 5 and 4 above the average of the third quarters of 1937-41.

Quarterly Returns for Eire

The birth rate during the third quarter was 23.9 per 1,000, or 3.8 above that for the corresponding quarter of 1941; with the exception of the second quarter of 1942, when it was 24.5, it was the highest of recent years. Infant mortality was 57 per 1,000 registered births, 7 below the rate of the September quarter of 1941 but 1 above the average of the third quarters of the preceding five years. The general death rate was 11.5 per 1,000; this rate has been fairly constant in the recent September quarters and has only varied between 11.4 and 11.7 during 1937-42. The death rate from pulmonary tuberculosis was 1.1 per 1,000, an increase of 0.2 in the rate for the corresponding quarter of 1941 and equalling the highest rate for this quarter during 1937-42. An increase in pulmonary tuberculosis was also recorded in the first and second quarters of this year. Other forms of tuberculosis yielded a rate of 0.2 per 1,000, which was the rate in the September quarter of 1941.

Returns for the Week Ending December 12

The notifications of infectious diseases in England and Wales during the week included: scarlet fever 2,769, whooping-cough 1,326, diphtheria 1,079, measles 13,287, pneumonia 989, cerebrospinal fever 75, acute poliomyelitis 7, dysentery 133, paratyphoid 7, typhoid 10, small-pox 1.

Medical News

Sir John C. G. Ledingham, F.R.S., is to retire on March 31, 1943, from the post of Director of the Lister Institute of Preventive Medicine, which he has held since 1930. The Governing Body of the Institute have appointed as Sir John Ledingham's successor Dr A. N. Drury, F.R.S., Huddersfield Lecturer in Special Pathology, University of Cambridge, and a member of the scientific staff of the Medical Research Council.

Electromedical apparatus cannot be supplied to institutions or individuals without licence from the Board of Trade on the surrender of a medical certificate. The latest Order on this subject, the Machinery, Plant, and Appliances (Control) (No 3) Order, 1942, which replaces and amends all previous ones, can be obtained from the Stationery Office or through any bookseller.

With the issue of November, 1942, the publication of the *Annals of Medical History* was suspended.

The late Mr. J. A. Fielden, who during his lifetime made large gifts to the London Hospital, has bequeathed to it the sum of £105,000 free of duty.

A company to be known as the Anglo-Iranian Pharmaceutical Company, Ltd. (the A.I.P.), has been formed in this country by a group of five leading manufacturers of medicinal products in order to facilitate the supply to Iran of pharmaceutical products made in the United Kingdom. A private limited liability company with an authorized capital of £50,000 has been registered, the constituent members being: Boots Pure Drug Company Ltd., British Drug Houses Ltd., Evans Sons Lescher and Webb Ltd., Glaxo Laboratories Ltd., the Wellcome Foundation Ltd. The registered office of the A.I.P. is at Tavistock House South, Tavistock Square, London, W.C.1. All communications should be addressed to the secretary, Mr. W. J. Williams.

VENEREAL DISEASES AS A CAUSE OF DEATH

According to Gottschalk (*Dtsch. med. Wschr.*, 1942, **68**, 845) the official statistics of causes of death so far as syphilis is concerned cannot be complete, for in many cases the true cause of death can be ascertained only by necropsy. As to the degree of reliability, a valuable indication is offered by the "Combined Statistics of Causes of Death in Magdeburg" for the years 1928–36, as follows:

Syphilitic Causes of Death	Deaths according to Clinical Findings (a)	Results of Necropsy			
		Incorrect Clinical Diagnosis (b)	Diagnosis Confirmed (c)	Additional Cases Discovered (d)	Total Cases (c + d)
Syphilis	194	59 (30%)	135 (70%)	117	252
Progressive paralysis ..	93	34 (37%)	59 (63%)	23	82
Tabes dorsalis ..	27	10 (37%)	17 (63%)	27	44
Aneurysm ..	8	5 (63%)	3 (37%)	25	28
Total ..	322	108 (34%)	214 (66%)	192	406

The investigation covers 8,182 cases, in which both the clinical diagnosis of cause of death and the post-mortem finding were available. The classification adopted was that introduced in 1932, and syphilitic aneurysm was reckoned as an independent cause of death in the group of venereal diseases. Of the 8,182 cases 322, or 3.9%, were recorded as due to syphilis. Necropsy showed that 108 of these (34%) should have been classified under another number in the list. In 214 of the 322 cases (66%) the clinical diagnosis was confirmed. However, an additional 192 cases were found post mortem to have a syphilitic cause of death, so that the total number was increased to 406, or 5% of the total. Although these statistics concern almost exclusively diagnosis made in clinics, necropsy revealed 26% more cases of syphilitic causes of death than was shown by clinical findings Paralysis as a cause of death was found more rarely post mortem than by clinical diagnosis. Necropsy showed 23% more cases of syphilis, 63% more cases of tabes dorsalis, and as much as 250% more cases of aneurysm.

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1.

ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated.

Authors desiring REPRINTS should communicate with the Secretary of the Journal Board, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors over-seas should indicate on MSS. if reprints are required, as proofs are not sent abroad.

ADVERTISEMENTS should be addressed to the Advertisement Manager (hours 9 a.m. to 5 p.m.). Orders for copies of the *Journal* and subscriptions should be sent to the Secretary.

TELEPHONE No.—B.M.A. and *B.M.J.*: EUSTON 2111.

TELEGRAPHIC ADDRESSES.—EDITOR, *Aitiology Westcent, London;* SECRETARY, *Medisecra Westcent, London.*

B.M.A. SCOTTISH OFFICE: 7, Drumsheugh Gardens, Edinburgh.

QUERIES AND ANSWERS

Treatment for Scalp Eruption

E. M. T. writes: In reply to J. A. M. (Nov. 28, p. 654): For years I have been a sufferer from psoriasis of the scalp, and often develop thick hard crusts. I recommend the following treatment, which I learnt from the *B.M.J.* years ago, and find astonishingly effective. Wash the whole scalp thoroughly with simple soap and water; rinse; then wash it with a good lather of soap spirit in warm water. The crusts are softened and can be easily and carefully removed with the comb. Then while the scalp is still damp apply sphagnol ointment. This treatment should be repeated every few days if necessary. The ointment stains.

W. H. writes: Has J. A. M. tried sulph. praecip. gr. 13; ac. salicyl gr. 13; ol. coc. nucif. ʒiv; paraffin. moll. ad ℥j?

Dressing for Cancer of Breast

Dr. G. BAYNTON FORGE writes: In reply to "Deodar" (Nov. 28, p. 654) I have found hydrogen peroxide a certain and quick remedy for this troublesome symptom. I have used it on 3 cases where operation was refused and always with most gratifying results.

Income Tax

Allowance for Domestic Staff

W. K. keeps two maids, of whom one lives in and the other attends from 8 a.m. to 7 p.m. Of the six living-rooms four are used for patients and a fifth is so used occasionally. The maids receive £140 per annum. W. K. is allowed a deduction of one-third of his rent and rates, which presumably covers the use of a garage, and £104 in respect of the cost of domestic service of the professional part of the premises.

*** In view of the large proportion of the ground floor which is used for professional purposes the ratio of one-third seems low, when it is remembered that the ground floor is the most valuable part of the whole premises. As regards the cost of service the inspector of taxes will no doubt contend that the effect of food rationing has to be taken into account as well as the higher cost of the food which is obtainable. But this is a question which must be decided on the actual facts of each case. We suggest that a reasonable basis would be one-half of the total domestic cost, and perhaps W. K. can calculate that figure approximately and compare it with the £104 hitherto allowed.

Deduction for Use of Residence

E. R. has hitherto been allowed to deduct one-half of the cost of rates, insurance, maid, gardener, lighting, heating, and repairs. The inspector of taxes now wishes to reduce the deduction to one-third of the costs. The house contains waiting-room, consulting-room, dispensary, lounge, and lavatory used wholly or partly for the practice, and one room downstairs, three bedrooms and a box-room used privately.

*** There is no fixed rule with regard to these deductions; the proper ratio clearly depends on the facts of each individual case. Sometimes a useful light is thrown on the question by looking at the other side of it—i e., what is the practitioner getting for private use and what would be a fair measure of its cost. On the individual items, one-half seems *prima facie* excessive as applied to gardener's wages and the cost of heating and lighting. So far as our experience goes one-half of the general expenses is not usually allowed except where there is some special element—e g., high rates on account of central position in a large town. Possibly E. R. can negotiate some intermediate ratio—e.g., 40%. We should not advise prosecuting a claim to 50% to the point of a personal appeal

House Let to Government—Liability

T. H. has let his house for £175—some of his furniture is still stored in it. The Schedule A assessment is £76, and he has now received a demand for tax on £66 10s. "excess rent." Is this correct? Can he deduct fire insurance on the house and £1 11s. 6d. on the furniture?

. The £66 10s. is correct. The liability arises under the Finance Act, 1940, and is calculated as under:

	£	s.	d.
Amount of rent	175	0	0
Deduct allowance for maintenance, etc.	32	10	0
	142	10	0
Less already assessed under Schedule A	76	0	0
"Excess rent"	£66	10	0

The fire insurance on the house is regarded as included in the scale allowance of £32 10s.; the £1 11s. 6d. in respect of the furniture is a private expense and cannot be treated as a deduction for income tax.

Income from Malaya

"APA MAU" came to this country a few years ago. Most of his capital is invested in Malaya. The income tax authorities ask for a statement of income credited to him there in the year 1941–2. What is the legal basis of liability for assessment in respect of this source of income for 1942–3?

. In law the income is assessable for 1942–3 on the basis of the amount of income arising in the year 1941–2, but inspectors of taxes have been authorized to arrange, in such cases as this, for tax to be accepted on the amount (if any) of income actually received in the year 1942–3; the balance of the tax assessed will remain in abeyance until it becomes clear as to what amount of the unremitted income will be receivable in this country.

Temporary Cessation of Work

C. J. S. was employed in the E.M.S. since the beginning of August, 1941. He became a hospital patient in August, 1942, but was paid by the E.M.S. for the three following months. During the year ended April 5, 1942, he earned £325 and his wife £85. After deducting the allowances due to him he has been charged tax amounting to £35 14s. 6d. He is now doing part-time work and will earn about £120 for the current year. He inquires: (i) Can he average the two years for purposes of assessment? (ii) When can he "be forced to pay last year's tax"? and (iii) What is he advised to do?

. (i) No; he ceased his employment and is in any case liable on the current year's basis for 1941-2 and 1942-3. (ii) and (iii) Legally the revenue authorities can take action against him at any time. It is, however, certain that they would regard his case sympathetically, and we advise him to write to the collector, explaining the circumstances fully, and, if possible, making an offer to pay something on account.

Honorary Surgeon to Hospital under E.M.S. Scheme

"Gamma" has been honorary surgeon to a hospital for many years. The hospital is now under the E.M.S. scheme and the staff is paid 1s. 6d. per bed per night for the military cases. He does not wish to receive this money and inquires as to his income-tax liability.

. If "Gamma" receives a share of the War Office payment he is liable to assessment on it, even if he hands it back to the hospital—he is merely disposing voluntarily of taxable income—and the same result would probably follow if he were to ask the hospital authorities to retain his share for their general purposes. His best course is to notify them that he desires to continue to act in a voluntary capacity and to be regarded as not entitled to any share in the payment in question.

LETTERS, NOTES, ETC.

Codeine in Vaccinia

Dr. S. WARSZAWSKI writes: With reference to Lieut. H. A. Oatley's letter on codeine in vaccinia (Sept. 26, p. 384) I would offer my confirmation of the facts advanced by him. After the collapse of France in 1940–1, when I was an inmate of a prison camp in Spain and acting as M.O. of the camp and later on as M.O. of the Polish Red Cross in Spain, I vaccinated or supervised the vaccination of many thousands of people, and I noted also the remarkable effects of the association of the drugs combined in the tab. cod. co. of the *National War Formulary*, 1941. Our formula was: acetylsalicylic acid, phenacetin āā 0.25 g., codeine phosphate 1/100 g. I used also other formulae, replacing the cod. phosph. by caffeine or codeine. There is no doubt that the results were not so good as with cod. phosph. I think, therefore, that it is not the codeine but the phosphate of codeine which matters. I think, too, that this is a point which is worth investigation, and also the determination of the optimum dose of cod. phosph. I have been using the Continental formula given above now for many years, and I have always found that it is a very useful antithermic, analgesic, and anticatarrhal compound.

Treatment of Anxiety States in Panel Practice

Dr. MARGUERITE STEWART (London, S.W.4) writes: From time to time communications in the *Journal* draw attention to the invalidism from the Army due to chronic and acute anxiety states. It is the early stages of anxiety before physical symptoms are firmly rooted that general practitioners should recognize and adequately deal with. This at present it is increasingly difficult to do owing to pressure of work. But in planning for the future let this side of practitioner treatment be made possible. Our panel system was formed before 1914 at a time when illness was treated on a physical level. Since then, increasingly, it has become apparent that much illness is psychological in origin, and that most illness has in it a psychological factor. To treat such illness requires more time and outgiving per patient than is possible under the present panel system. Recently, with a panel less than one-tenth the permissible number, I saw 17 panel patients on one day. The preventive treatment of anxiety states is one of the most interesting privileges of general practice. It can only be tackled adequately in a practice where numbers are limited, and practitioners have had the opportunity for training in the detection and treatment of this kind of work.

MEDICINE 100 YEARS AGO

Extract from a leader on rumours in the "political press" that "the poor law commissioners have recently dismissed all those who held Scotch or Irish diplomas from their offices under them as unqualified," from the *Provincial Medical Journal* of Dec. 31, 1842:

"The qualifications for union medical officers admitted by the poor-law commissioners are of four kinds. We shall recite them here, as several of our friends in the country seem to have forgotten that we published them many months since. (1) A diploma from the Royal College of Surgeons, together with a degree in medicine from an English university, or the London College of Physicians. (2) A diploma from the London College of Surgeons, with a certificate from the London Apothecaries' Hall. (3) A diploma from the London College of Surgeons, and a right to practise as an apothecary acquired by the person having been in practice as an apothecary before August 1, 1816. (4) A commission as surgeon, or assistant-surgeon, in Her Majesty's navy, or as surgeon, assistant-surgeon, or apothecary, in the army; or as surgeon, or assistant-surgeon, in the East India Company's Service, dated previous to August 1, 1826.

"To those who are not familiar with the numerous questions agitated during the discussion of poor-law medical relief, or the actual state of the laws which affect the medical profession generally, the above cited regulations of the poor-law commissioners may appear complex and unsatisfactory; but a few remarks will serve to explain the motives which led to their adoption. In the first place, the necessity of a double qualification for union officers—of a license to practise both surgery and medicine—had long been urged on the commissioners; and to this they at length acceded. In the second place, the 109th section of the Poor-law Acts requires that the medical officer should be 'a person duly licensed to practise as a medical man.' The question then at once occurs, who is duly licensed to practise as a medical man within the precincts of England and Wales? Upon this point great ignorance prevails amongst the members of the profession; for the exclusive privileges of the corporate bodies extend further than even they themselves seem to be aware. The College of Surgeons in London have the exclusive right of licensing persons to practise surgery throughout England and Wales. The right to practise medicine may be conferred by the College of Physicians, the Universities of Oxford and Cambridge, and the Apothecaries' Hall. In addition to the privilege of conferring licences to practise medicine, these corporations enjoy the power of prohibiting all who are not of their body, from practising medicine within their territorial jurisdictions. The statutes of 3 Hen. VIII., c. 11, and 14 Hen. VIII., c. 5, exclude every person from practising physic anywhere in England or Wales, unless he be a graduate of Oxford or Cambridge, or admitted to practise by the London College of Physicians. The charter of Car. I., confirmed by the 18th Geo. II., c. 15, prohibits every one from acting as an apothecary in England and Wales, who has not a certificate from the Apothecaries' Company, with the exception of those in practice as apothecaries previous to 1815, and the army and navy surgeons of 1826, who are privileged by a particular act which expired on the 1st of August, 1826."

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

LONDON SATURDAY JULY 4 1942

WAR BONUS FOR INSURANCE PRACTITIONERS

The following is the text of the application which the Insurance Acts Committee of the B.M.A. has made to the Ministry of Health for a war bonus for insurance practitioners.

June 24, 1942.

DEAR SIR,

The Insurance Acts Committee desires to make application on behalf of insurance practitioners for a war bonus on the grounds set out in this communication.

1. As the Ministry is aware, when the war broke out the Insurance Acts Committee was about to submit an application for an increase in the insurance capitation fee of 9s. based *inter alia* on a statistical investigation of the work done by insurance practitioners for insured persons conducted under the auspices of an eminent statistician. While it is recognized that such an application for an increase in the basic capitation fee could not then be proceeded with as if the country were still at peace, it is relevant to refer to this proposed application because it was the outcome of widespread dissatisfaction with the pre-war capitation fee.

2. Although the Insurance Acts Committee loyally accepted the award of the Court of Inquiry in 1937, it cannot disguise the fact that it was unexpected, perhaps to the Ministry as well as to the Insurance Acts Committee, and that it was resented by insurance practitioners. This feeling of dissatisfaction with the pre-war capitation fee is the background against which any application for a wartime bonus must be examined.

3. For the first fifteen months of the war the Insurance Acts Committee refrained from applying for an increased capitation fee, despite the rapidly increasing cost of living and cost of conducting practice. The events which have followed the Committee's application in the early part of 1941 are not regarded as satisfactory by the Committee. The claim put forward on the grounds of practice expenses was based on a most conservative estimate, prepared for the Committee by an independent expert. In spite of this the first reply by the Ministry was to reject it out of hand. The subsequent decision did in fact meet the claim for increased practice expenses as they stood in early 1941. But the Ministry's offer of 9s. 9d. taken as a whole, and related not only to practice expenses but to the new class brought into insurance by legislation, was accepted under protest by the Conference of Local Medical and Panel Committees out of a sense of national duty and not as an expression of acquiescence in the proposed terms. A similar offer made in times of peace would undoubtedly have been rejected by the overwhelming majority of the profession. The experience of the last few months had done much to aggravate the already serious sense of frustration and resentment rife among insurance practitioners.

4. It was agreed by the Ministry that the additional 9d. did not include any element in respect of cost of living. It includes an amount in respect of the new group and an amount in respect of practice expenses as they stood earlier in the year, though this increase has commenced only on January 1, 1942, after two and a quarter years of war.

5. The war has laid upon the medical profession a specially heavy burden. It has meant the withdrawal from National Health Insurance of a vast number of healthy lives. Their places in industry have been taken by older men, many of whom have returned to industry after periods of retirement or prolonged unemployment; by middle-aged as well as young women with no previous experience of industry; and by other groups whose general standard of fitness is lower than those whom they have replaced. An inevitable result of the introduction into industry of persons of all ages without previous industrial experience is, as the result of new stresses and new hazards, a considerable rise in the amount of medical service which is, on average, required for insured persons. Those who are returning to insurance after service with the Forces—and the number is growing—are far less healthy than the average, and so need additional medical attention; indeed, many of them can be described as permanently damaged lives. This position was recognized in the last war when special additional remuneration was paid for discharged Service men. The average age of insured persons has risen. The spokesman for the Ministry (Dr. Paterson) at the last Court of Inquiry recognized the implication of this when he said: "It is evident that it must be the older people approaching the ages in which the death rate was highest who give the doctor more work." The proportion of women in National Health Insurance has risen, many of these women being employed in unaccustomed industrial work. Such has been the change in the make-up of the insured population as a result of the war that the burden upon insurance practitioners in respect of the same number of insured persons has risen, both as to visits and attendances and the work entailed by the keeping of proper medical records. The black-out has meant an increase in the average time spent in evening and night visits, and in many cases an additional risk. To sum up, war conditions, including the black-out, have meant a measure of human stress which has found expression in increased burden on the insurance practitioner in terms of time, strain, and responsibility.

6. Wartime conditions have made it impossible to collect reliable statistics relating to the work done by insurance practitioners. Opinions differ as to whether the number of prescriptions issued is a general guide. After the initial drop in the early months of the war, the figure for the beginning of 1940 increased to well above the pre-war figure. Since then it has fluctuated and is now rising steadily. It is not now far short of the pre-war figure, and an epidemic would send it well above the pre-war level. The experience of practitioners shows that after the first few months of war the number of prescriptions given has less reference than ever before to the service rendered. The truth is that there is no accurate measure of the work now undertaken by insurance practitioners. It is, however, a modest statement to make that the strain on the community as a result of the war has increased the burden of work on insurance practitioners.

7. There is one other general consideration which the Committee puts forward. In 1918 the Ministry of Health agreed to a wartime increase in the capitation fee for practitioners with net incomes below £1,000 a year, varying from 10% to 12½%. In 1918 the cost-of-living index figure varied between 185 to 225 in relation to 100 in August, 1914. To-day the official figure stands at 200 in relation to 100 in August, 1914. On the assumption that the official figures are applicable to practitioners, and that practice expenses have risen to a similar extent, the capitation fee of 9s. 9d. to-day is worth, in terms of money values in 1914, 4s. 10½d. On the assumption that practice expenses have risen by only 50%, the capitation fee of 9s. 9d. to-day is worth, in terms of money values in 1914, 5s. 4½d. This means that insurance practitioners have since 1914 suffered a reduction of *real* remuneration from 7s. 3d. to a figure between 4s. 10½d. and 5s. 4½d., depending on the extent of the increase in practice expenses since that year.

8. If the official cost-of-living figures be related to those in August, 1939, instead of to those in August, 1914, the present figure is 128 in comparison with 100 on August 1, 1939. This is the general cost-of-living figure, derived from working-class budgets. There is no up-to-date evidence of any validity that the proportionate rise in middle-class expenditure differs materially from that in working-class expenditure.

9. A previous application for an increase in the capitation fee in respect of cost of living has been met with the reply that it is contrary to Government financial policy to agree to such increases for other than the lowest income groups. The Government has already departed from this policy. At first the officially approved limit for cost-of-living increases was £250 a year. Later it rose to £350 a year. To-day it stands at £500 a year, which is a net figure for superannuated officers enjoying non-contributory pensions, or £560 in terms of total emoluments. But even this restriction is not of universal application. In the case of local government officers there is no

income limit at all, and not only have medical officers of health receiving higher salaries in some instances received cost-of-living bonuses but such bonuses have, where his approval was necessary, been approved by the Minister. Thus the Minister has admitted the principle of cost-of-living bonuses for higher salaried groups. It is noted that the Minister has also approved, with effect from October 1, 1941, an increase of more than 16% in the dispensing fees of chemists for medicines dispensed for insured persons.

10. There are insurance practitioners whose gross incomes, though apparently larger, actually fall, in so far as they are net incomes, within the range of the £560 limit. There are many practitioners whose gross incomes have fallen to an extent to which their expenses can never fall, owing to their obligations as insurance practitioners. In any event, the argument that inflation would be encouraged by increases in the higher earning groups is without substance. They constitute both in numbers and in aggregate income so small a proportion of the community and the community income that the effect in terms of inflation of a cost-of-living increase would be negligible. The groups which represent the largest volume of national income have in the main already received in one form or another wartime increases in remuneration.

11. There is one further argument which at first sight may seem irrelevant. Those insurance practitioners who remain in civil life are maintaining the practices of the absentee colleagues and assuming responsibility for the care of their insured persons at half the current capitation fee. The general effect of this for those remaining in practice is to reduce the average capitation fee, which is rapidly falling. This, it might be argued, is the profession's own affair. But, it should be pointed out, it is Government policy that the salaries of absentee employees of central and local government should be made up to their peacetime level, and as taxpayers and ratepayers the medical profession, in common with other sections of the community, is contributing to this expense. Again, moneys derived from National Health Insurance contributions are already being used for the purpose of making up the salaries of absentee employees of approved societies and insurance committees. The medical profession could not honourably have acted otherwise than to safeguard, so far as lay within its power, the practices and the emoluments of practitioners in the Services. In a number of areas this arrangement cannot but bring the capitation fee down to a level which, after expenses are paid by the remaining practitioner, leaves little margin for general living expenses. This is, it is submitted, a factor which should be taken into consideration.

12. The medical profession has no desire to profit by the war. It has no desire to escape the general increase in national responsibility. It is, however, determined to do its utmost to secure that the pre-war inadequacy of the basic capitation fee shall not be unfairly accentuated at a time when it is working under the most extreme difficulty.

13. These are the general arguments which lead the Insurance Acts Committee, after the most careful consideration and after consultation with every Panel Committee in the country, to press for a substantial increase in the capitation fee while present circumstances continue. That the time has come for such an increase the Insurance Acts Committee is convinced, and it desires to open negotiations with the Ministry in regard to the amount of that increase.

Yours faithfully,

G. C. ANDERSON,
Secretary.

To the Secretary,
Ministry of Health,
Whitehall, S.W.1.

Owing to pressure on space the conclusion of the G.M.C. report is held over to a later issue.

Correspondence

Salaried Appointments

SIR,—Fresh doctors are constantly being called for by the Forces, and this means that appointments to an increasing number of salaried jobs will have to be sanctioned by the various Local Medical War Committees. I should like to suggest that these committees should not sanction the appointment to a position carrying an emolument of any doctor who has refused to join the Protection of Practices scheme. This is not a question of professional jealousy or etiquette; it is merely recognition of the principle that a doctor who wishes to take advantage of the present emergency at the expense of brother practitioners who have been called up is not a fit person to be in charge of a job sufficiently responsible to carry with it a salary. In other words, "black marketeering" is as odious and reprehensible in medicine as in other walks of life, and should be recognized and treated as such.—I am, etc.,

Winsford. W. N. LEAK.

BIRTHS, MARRIAGES, & DEATHS

BIRTHS

STUART-HARRIS.—On June 22, 1942, to Marjorie, wife of Major C H. Stuart-Harris, R.A.M.C., Hamel House, Perham Down, Andover, a son.

SWANSTON—At Kilburn House, Thirsk, on June 18, 1942, to Mollie (*née* Hartley), the wife of Dr. Kelly Swanston, twin daughters

MARRIAGE

THOMAS—FRENCH—On June 17, 1942, at Hammersmith, Ronald Lionel Thomas to Kathleen Mary French, M.B., B.S.

DEATH

FERGUSON—On June 20, 1942, R. L Ferguson, M.D (Manch.), of Lynton, Upper Lloyd Street, Manchester.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY JULY 11 1942

GENERAL MEDICAL COUNCIL

DISCIPLINARY CASES (*concluded*)

Drug Addiction

The Council considered the case of Brendan O'Carroll, registered as of Castlereagh Road, Belfast, who was summoned on the charge that in March last he was convicted (after having pleaded guilty) of being in charge of a motor-car while under the influence of a drug, and was sentenced to 28 days' imprisonment. Evidence was given as to purchases of cocaine solution by Dr. O'Carroll at about the time of the offence in the district in which he was acting as locum-tenent. Dr. O'Carroll, who was not present, wrote stating that he considered it in his own interests that his name should be removed from the *Medical Register*. He said that he had been a drug addict, and it was now his intention to cure himself of that disease by following a non-medical occupation. The Council ordered the erasure of the name.

The case was heard of Alexander Gordon Bonnyman, registered as of Barking Road, Canning Town, who appeared on the charge that in February last he was convicted at the Central Criminal Court, of unlawfully killing Elizabeth Galloway Bonnyman, his wife, and sentenced to twelve months' imprisonment. The evidence as outlined by the Council's solicitor was that both Dr. Bonnyman and his wife were long-standing morphine addicts. When taken to hospital just before her death Mrs. Bonnyman's condition was found to be absolutely appalling: her arms and legs were distorted through disuse, and she weighed only 3 st. 10 lb. She was suffering from abscesses which appeared to be due to the use of dirty needles. A post-mortem examination showed death to be due to heart failure owing to poisoning from the abscesses, starvation, and bronchopneumonia brought on by her low powers of resistance.

Dr Bonnyman made a long statement to the Council. He said that his wife had been a confirmed morphine addict for seven or eight years continuously, during which time her physicial condition was undergoing gradual decay. He did all in his power to bring about her treatment in hospital, but his arguments were unavailing. He also did what he could tc maintain at the maximum his wife's diminished strength until such time as he could safely effect the withdrawal of the drug. It was her addiction to morphine which brought about her weakened condition.

"During most of my struggle and my anxiety for the well-being of my wife," he went on, "I myself was a victim of the drug. I could appreciate the suffering, both mental and physical, which even the dread of withdrawal would occasion, and this appreciation it was which led me into the error of a too kindly approach to my wife's problem. You cannot appreciate the problem of drug addiction from the addict's point of view. One loses one's strength of will, and, although one wants to beat one's enemy, when the effects of the previous dose have worn off this fine edifice of self-defence and strong will to survive crumbles. When that dreadful gnawing, that suffering, that feeling of sickness which assails one is at its most acute, then all good intentions are scattered to the winds. It is that black outlook which influences the addict. That was the feeling which I am sure was in my wife's breast when she was so adamant in her refusal to have hospital treatment and to have another doctor to see her."

He had erred towards leniency whereby the speed of withdrawal until the last five or six weeks of her life was checked. The drug would have been withdrawn more quickly but for his appreciation of the dreadful suffering which a rapid withdrawal entailed. His wife's daily consumption for a number of months until September, 1941, was 9 grains. He gradually reduced this to 1¼ to 2 grains just before her death. During the actual process of withdrawal he had on occasion for therapeutic reasons to increase the dose, and on this point he complained that the judge, in directing the jury, described what he had done as a wanton pandering to the whims and wishes of his wife. Medical men with experience in the treatment of morphinism would appreciate the likelihood of collapse owing to too rapid withdrawal of a patient already physically weakened and dependent on the stimulus which morphine alone could give. This collapse was very sudden and severe, with sudden fall in the pulse rate and blood pressure, deathly pallor, cold, clammy skin—a picture calculated to make the most experienced clinician quail. When he increased the drug it was because of "withdrawal collapse," the pulse rate falling as low as 43. Judge and jury could not rid themselves of the idea that the problem was a standard one, to be solved by standard means, like a sum in algebra. No such convenient method presented itself to the physician in his struggle with a drug addict. It was a battle of wits, and the nearer the relationship between the patient and himself the less was the physician's influence, until, in the case of the husband and wife, the scales were heavily weighted against him.

Dr. Bonnyman ended by saying that surely he was not to be held responsible for his wife being a morphine addict. In no way did he force her to become such: in fact she had been an addict for many years. He himself had previously been addicted to morphine, but was cured in 1934, with no relapse until August, 1941, but in the interval until his wife's death morphine took its toll upon his own physical and mental life so that he did not with a rational mind approach the problem which his wife's case presented. He also pointed out that if morphine was sold in solution, 0.2% or under, and was mixed with some other active constituent, it was exempt from the regulations of the Dangerous Drugs Act. "A man in the street, if he knew how to write a prescription, could take it to any chemist, and any chemist is quite within his legal rights in dispensing that prescription." His wife, by means of such prescriptions, which she could make out for herself, obtained such 0.2% solution and boiled and concentrated it.

The Council ordered the erasure of Dr. Bonnyman's name from the *Register*.

Conviction of Receiving Stolen Property

The Council considered the case of Erich Hohenberg, registered as of Beverley Court, W.4, who appeared on the charge that in April, 1942, he was convicted at Marlborough Street police court of receiving a book, value £1 15s., knowing the same to have been stolen, and sentenced to four months' imprisonment with hard labour. It was stated that Dr. Hohenberg was 32 years of age and an M.D. of Vienna. He was one of a family of 7 well-known Austrian medical men. In 1938 he left Austria for political reasons, and in 1940 he obtained the Scottish qualifications and was registered. He obtained work in the Cancer Research Department of Middlesex Hospital. His wife obtained a position in a library. Both she and her husband were interested in books and she used to bring books home. It had been brought out in the proceedings—a fact previously unknown to the husband—that as a young girl she had had a tendency to steal, and her parents, who were wealthy people in Vienna, decided that the best method of treatment was to place everything at her disposal so that she would have no wish to steal. The wife admitted the larceny, but the husband disputed that he knew the books had been stolen. The magistrate, however, having convicted both, decided, said defending counsel, that Dr. Hohenberg, being the elder person and the husband, should bear the major penalty.

Evidence as to character was given by Dr. Eugene Felix, Dr. F. Silverstein, and Prof. Ernest Freund, all formerly of Vienna, but the Council found the conviction proved and directed erasure of the name.

Convictions for Illegal Operation

The Council considered the case of William Spencer Lewis, registered as of Redcliffe Gardens, South Kensington, who was summoned on the charge that at Surrey Assizes in February, 1942, he was convicted of unlawfully using an instrument with intent to procure miscarriage in the case of four women and of conspiring with two other persons to procure the miscarriage of a fifth, and was sentenced to three years' penal servitude on the first four counts and eighteen months' imprisonment on the fifth (all concurrent) and ordered to pay the costs of the prosecution.

Dr. Lewis did not appear nor was he represented.

It was stated by the solicitor to the Council that Dr. Lewis had surgeries in South Kensington and Shaftesbury Avenue and a house at Staines. In the first case the woman, after seeing her own doctor, got the name of Dr. Lewis from some other source and went to see him at South Kensington. She told him she was pregnant and said that she thought he could help her. He told her to come and see him at his house at Staines and that his fee would be £35. This was fixed without any medical examination. She went to his house and from there to a bungalow, where she was treated for eighteen days. In the second case in similar circumstances £30 was paid, in the third case £45, in the fourth case 60 guineas, and in the fifth case £65. The defence which Dr. Lewis put in was that the women were inevitably going on to miscarriage and that he did not use any instrument, but treated them in an antiseptic way and allowed them to miscarry in his house.

The Council directed the Registrar to erase Dr. Lewis's name from the *Register.*

The case of SEWERYN KAMINSKI, registered as of Renfrew Street, Glasgow, was heard. He had been convicted at Glasgow in March, 1942, of procuring abortion and sentenced to eighteen months' imprisonment. Dr. Kaminski did not attend. It was stated that he was M.D. of the University of Warsaw and had been admitted temporarily to the Foreign List of the *Medical Register.* Dr. Kaminski had charged £2 for the examination of the woman, and £19 was paid him later; his total fee was £28, £7 remaining owing.

In this case also the name was erased.

Charge of Interfering with Persons in H.M. Service

The Council heard the case of JOHN KNOX THOMPSON, registered as of Princes Road, Liverpool, who was convicted at Liverpool Assizes in October, 1941, of interfering with persons in H.M. Service and attempted false pretences, and was sentenced to four years' penal servitude and to pay the costs of the prosecution.

Dr. Thompson was not present nor was he represented.

The Council's solicitor said that under King's Regulations soldiers on furlough who required medical aid should apply to the nearest Service hospital, or, if that was not possible, to a civilian medical practitioner. This case arose out of an application by soldiers on furlough to Dr. Thompson. He was charged on nine counts with issuing untrue medical certificates to soldiers purporting to show that they were unfit for duty and to travel, whilst in fact they were fit. The evidence was to the effect that soldiers on leave in Liverpool went to the doctor when their leave expired and on payment were, without any examination, issued with medical certificates that they were suffering from gastric influenza. In one instance a soldier on leave was ill and went to the doctor, but refused to pay the money asked and received a certificate that he was fit for duty and to travel, but when he left the surgery he collapsed in the street, and on examination by an Army doctor was ordered to bed and was detained for ten days with a highly infected and septic throat. The written defence was a denial of the allegations.

After deliberation *in camera* the Council directed the Registrar to erase the name.

Other Cases

JOHN NEIL LEITCH, registered as of Great Cumberland Place, London, appeared before the Council on a charge of having been convicted in March last of obtaining credit of over £10 while an undischarged bankrupt, and was sentenced to three months' imprisonment in respect of each of three charges, the sentences to run concurrently. Dr. Leitch attended and gave an explanation of the circumstances in which credit was obtained.

After deliberation *in camera* the Council did not see fit to direct the Registrar to erase Dr. Leitch's name.

Two or three other cases of charges against practitioners were postponed until the next session. In another case the entire hearing was *in camera* and lasted more than two days. At the conclusion, the facts alleged against the practitioner were found not to have been proved to the Council's satisfaction. The charge was not read in open Council.

BRITISH MEDICAL ASSOCIATION

ANNUAL REPRESENTATIVE MEETING, LONDON, 1942

The Annual Representative Meeting of the British Medical Association will, subject to war conditions, be held at B.M.A. House, Tavistock Square, London, W.C.1, on Tuesday, Wednesday, and Thursday, September 8, 9, and 10, 1942.

RESOLUTIONS ON MATTERS OF WHICH TWO MONTHS' NOTICE MUST BE GIVEN

Mode of Election of Council by Groups in Great Britain or Northern Ireland

MOTION by GRIMSBY: That By-law 55 (3) be amended to read as follows:

> The said voting papers shall be sent to the Association at the Head Office within such time as the Council may from time to time prescribe by notice given as aforesaid, and the particulars which shall be included in the voting papers shall be confined to the candidate's address.

Election of members of Council by (*a*) Isle of Man, Lancashire and Cheshire Branches (Group C); (*b*) Derbyshire, Leicester and Rutland, Lincolnshire, and Nottingham Branches (Group D); (*c*) Metropolitan Counties Branch (Group I); (*d*) Dorset and West Hants, South-Western, and Wiltshire Branches (Group K): the following is the result of the voting in these elections.

Group C		
F. M. Rose	254	*Elected*
E. I. Claxton	213	
Barbara M. L. Abercromby	167	
R. Baring Davidson	134	
R. L. Newell	429	*Elected*
D. R. Owen	97	
Group D		
F. Joselin Jauch	144	
E. Lewis Lilley	259	*Elected*
Group I		
H. H. D. Sutherland	312	
A. Phillips	407	
Dame Louise McIlroy	377	
P. Inwald	517	*Elected*
E. A. Gregg	319	
V. Zachary Cope	418	*Elected*
F. Gray	268	
H. Vickers	121	
W. W. Fox	432	*Elected*
M. F. Moloney	451	*Elected*
George de Swiet	281	
Group K		
O. C. Carter	167	
D. Stanley-Jones	17	
F. A. Roper	266	*Elected*

G. C. ANDERSON,
Secretary.

SCOTTISH LOCAL MEDICAL WAR COMMITTEES

CONFERENCE OF REPRESENTATIVES

A meeting of representatives of Local Medical War Committees and members of the Scottish Central Medical War Committee was held in the Scottish House of the B.M.A. on June 12, Mr. Thomas Johnston, Secretary of State for Scotland, presiding. After welcoming the representatives and thanking Local Medical War Committees for their work, Mr.

Johnston referred to the Clydesi
ment for the care of the
industrial workers, and said
Government was watching the
ment of this scheme with grea
He then introduced Lieut.-Ge
Director-General, Army Medica
who also thanked the Scottisl
Medical War Committee and
Committees in Scotland for the
with which they were dischargi

LONDON SATURDAY JULY 18 1942

THE G.P. AS THE BASIS OF THE MEDICAL SERVICE OF THE FUTURE

BY
A. STAVELEY GOUGH, M.B., F.R.C.S.
AND
A. A. DUFFUS, M.B., Ch.B., D.P.H.

In the concluding paragraph of an article on national health policy that appeared in the *Supplement* of March 7 the question whether a State Medical Service should be based on the practitioner or the hospital was considered. It was there stated that, according to some, "a scheme based on the hospital would give a false conception of medicine. . . . The hospital deals, generally, with the abnormal; the general practitioner, generally, with slight and temporary deviations from the normal. The hospital is a curative service, and the very need for it proclaims the failure of other services. . . . If the position of the general practitioner were strengthened it would prevent much unnecessary resort to hospitals. A service based on the hospital might even deter people seeking the preventive and advisory side of general practitioner service."

The inherent logic of this position becomes more apparent when the situation is carefully analysed. It will be generally agreed that over 75% of the usual ailments suffered by the population are of such a nature that specialist treatment is unnecessary; it may even be harmful, since the specialist outlook is inclined to miss treatment of the patient as a whole, and therefore fails to give full consideration to the environmental and economic surroundings.

Environmental circumstances are responsible for a high proportion of illness, and can be understood only by those working in direct contact with the patient or, more particularly, with the family. Many relatively minor illnesses will develop and form the basis of more serious disability if the patient is not constantly advised as to the planning of his future actions from both a therapeutic and a hygienic point of view. The advice thus given may well be the most effective form of preventive medicine, and it is undoubtedly best given by the family doctor, who usually understands the difficulties and limitations under which his patients may act and live.

The Early Recognition of Illness

In any form of medical service the majority of illnesses must be treated by the general practitioner, and it follows, therefore, that the better the service the less the incapacity and future mortality that are likely to result. It is also obvious that the G.P. must be the first to be able to discover the signs of serious illness, and few authorities will deny that the incapacity or mortality arising from such illnesses depends in the main on their early recognition and immediate handling: thus it is well known in the fields of medicine that the mortality rate in pneumonia largely rests on the recognition of the earliest signs and symptoms, with the immediate institution of the appropriate treatment. The application of such treatment by a specialist later may not improve the mortality rate; indeed, the delay will almost certainly increase it.

In surgery, too, it is becoming increasingly obvious that the general mortality rate of the usual acute emergencies is influenced much more by early diagnosis and hospitalization of the patient than by the individuality of the surgeon who may operate. Here again the time factor is all-important.

If the above statements be generally accepted it becomes obvious that any marked improvement in the prevention of incapacity and the lowering of mortality arising from illness must primarily depend upon the formation and maintenance of the highest type of G.P. service and the recognition that this service forms the key to the practical application of all further medical and surgical advance. It is, therefore, important that this service should form the basis of future policy.

For the furtherance of these ideas we propose that the G.P. service shall be given such a position that it will not fail to attract men of a calibre reasonably equal to that of the specialist. (To-day it would appear that a large proportion of our students are attempting to become very sectionalized specialists, often without any good basis of general training other than that obtained at the teaching hospital.)

The G.P. Hospital Unit

The maintenance of the efficiency of a G.P. service is of paramount importance, and we suggest that this could best be attained by the formation of G.P. hospital units. At present it can be said that, in general, the best G.P.s are those who have hospital appointments or have access to hospital work. In view of the opinions that have been expressed about the staffing of all hospitals by consultants and of health centres or communal surgeries by G.P.s, there seems to be a real danger that the latter may have to pass on to specialists all cases except those of minor illness; this will lead to deterioration in G.P. service, not improvement.

It is now very evident that domiciliary treatment is becoming more limited, not only through the desire of the doctor and patient for up-to-date treatment but also because of social and domestic difficulties. Domestic and home nursing "help," which has been such an aid in the past, is now more than ever difficult to obtain. The well-to-do can enter nursing homes or engage private nurses, but the poorer classes often have no choice but to go to hospital, mostly through domestic and not medical necessity. There they occupy a hospital bed which should properly be devoted to a case requiring investigation or real hospital-type treatment. It is suggested, therefore, that appropriate hospital accommodation could and should be provided by the formation of special hospital wards set aside for the treatment of such cases by G.P.s. Such accommodation might be of a standard somewhat below that necessary in the special-treatment wards of the hospital. It is important that these wards should be part of a general hospital unit and that they should be under the direction of the medical superintendent or other hospital authority. General practitioners would treat their own cases, and under any proposed extension of the National Health Insurance scheme it could become a statutory obligation for them to do so; they should also be able to call upon the services of the hospital specialist's department when they considered that the occasion arose, or on the advice of the medical superintendent, so that cases requiring specialist treatment could be immediately transferred to the appropriate ward. General practitioners thus closely bound up with the hospital would undoubtedly have a higher standing with the public, would have a far more intimate contact with other general practitioners and specialists, and would have an incentive to keep their work up to the average standard. They would be encouraged to act as clinical assistants by rota in special departments, unless they were hoping to proceed to some specialist degree, when they might prefer to remain attached to one department.

Objections may be raised that it will be impossible for the nursing staff to deal with the large numbers of doctors coming into the wards. Under present arrangements there may be some truth in this, but it must be realized that these wards will have to be specially organized and staffed, and we believe that the difficulty can be got over. The nursing homes have been dealing with the problem successfully for years.

Conclusion

We feel that attachment of the G.P. to hospital would be more likely to improve the standard of medical efficiency than would his attachment to an outside diagnostic health clinic alone. For convenience in scattered or rural districts, the health centre or communal surgery could be combined with these general-practitioner beds in the same building, and such beds would be under the administration of the parent district hospital.

In short, we are of the opinion that any practical advance in medicine must depend upon a higher grade of G.P. whose ability and interest are maintained by link with a hospital. The present-day tendency to sectional specialization and the gradual disappearance of the former consultant make it necessary that the G.P. should be well qualified with an all-round knowledge, so that he may best serve his patient and the specialist by intelligent reference to the right department. This cannot be achieved if, throughout his career, he is not in a position to obtain first-hand knowledge of the handling of the more serious cases.

Correspondence

Future of Medical Practice

SIR,—Those of us who have been studying the future of medicine with varying degrees of instruction and wit appear to have divided into two bodies of opinion. One body advocates an evolutionary change, meaning a slow progress to better conditions and wider service; the other believes that a radical upheaval of our whole health service is a matter of urgency.

It is always pleasanter and easier to take one's time, to plan one's route to the ultimate goal, and errors of judgment and topography can in this way be largely avoided. But this is not the way of the world. Evolution is not a gradual process unless recorded from a great distance and over a long period of time. It consists essentially of prolonged periods of little change punctuated by sudden steps forward. Consider the habits of birds, insect life, the world's diet, or what you will. The main factors in their evolutionary changes are such dramatic events as drought, famine, pestilence, the industrial revolution, the invention of steamships, wars, and so on. In the evolution of medicine we find similar events—anaesthetics, wars, sulphonamides, the National Health Insurance Act, and so on—bringing about evolutionary change by revolutions.

We seem to be on the brink of another medical revolution. The value of health to the community has appeared as an asset whose worth has not hitherto been appreciated, and the efforts of the community to promote and safeguard it are considered inadequate. Mr. Samuel Courtauld, the well-known artificial silk industrialist, recently said that "the haunting fear of illness and old age is the deepest-seated cause of industrial discontent." Such words from such a man are worth remembering. To-day, medicine is seen to be only a part of the great problem of health, and is found to be inseparable from its companion problems of nutrition, housing, clothing, education, employment, recreation, and so on.

Much attention has of late been paid to the organization of the hospital system. Important as this is, it is not one of the great events which will be regarded by future students of the history of medicine. The outstanding impending change in medicine is the adoption of the clinic system for the whole country, where doctors will work in groups instead of either alone or with one or two partners. For, once this change is effected, the results will be far-reaching and revolutionary. The general practitioner of the future will then have an expectation of life approaching that of the other professions, instead of one even below that of the miner. He will have time and opportunity to do much more thorough and efficient work than he could possibly do at present. The fact of having adequate room and access to immediate ancillary work, the help of nurses and clerks, the presence and co-operation of other practitioners of his group, suitable off-duty periods and regular holidays, that spirit of emulation ever present in the human species which will make one clinic endeavour to outshine its neighbour—will all promote a service far superior to anything ever before offered to the community.

Pensions for doctors and their widows, steady income capable of increase by deserved promotion, homes removed from surgeries and noisy street corners will appeal to all the younger and most of the older members of the profession, and certainly to the great majority of their wives. Although the gross income in some cases will be decreased, the net income will be greater for the younger men, and probably little lower for the older men. The expenses of large premises and the resultant extra domestic assistance will disappear; life in a smaller house or flat will lower the cost of rates and rent; the money set aside for life insurance and purchase of a practice will not be needed; bills for drugs and instruments and all those smaller items connected with the running of a practice will no longer arrive; freedom from financial worry or embarrassment will lighten our lives.

The cost of running this scheme will be no greater than the cost of the present medical services. The cost to set it in motion will be far outweighed by the benefits which will accrue to the community. The administration must be in the hands of those most capable of working it. Local, regional, and divisional councils will be needed. These must be staffed by active members of the profession, assisted by democratically elected representatives of the lay public and a representative of the Government.

To lead the community in a search for optimum health there must be developed a means of doing so. When doctors work singly such long hours as they do at present, it is too much to expect them to meet and discuss their work and the possibilities of improvement. They will only meet if things go seriously wrong. The clinic system, however, will get men together, and when men work together as a body they get things done. They can produce integrated work and can give the community the result of combined service. On the other hand, if we as a profession adopt a passive, waiting attitude we shall soon find ourselves the slaves of a bureaucracy more interested in statistics than personalities. Then the fundamental core of British medicine—the family and the family doctor—will die, smothered in formless forms, certificated to death.—I am, etc.,

Leeds R. A. MURRAY SCOTT.

Serving Officer Views State Medicine

SIR,—I have been perusing such copies of the *Journal* as I have with me—all, with the exception of 3 or 4 numbers, from June 28, 1941, to May 9, 1942—and I find there are approximately 75 articles, letters, etc., on the subject of State medicine, planning for the future, and so on. I have been able to find 3 only among all these which are signed as being from medical men at present with the armed Forces This is due, I am sure—in fact I know—not to lack of interest in the future but to a feeling of hopelessness, a feeling of being "tucked away" in the Services unable to do anything while one's future and all that one is fighting for are being debated and settled by others who are able to express their opinions more freely and more often.

I would like to draw attention to a letter in the *Supplement* of August 30, 1941, from a Squadron Leader, R.A.F.V.R., who states: "But when it is all over I hope to return to a life like that which I was called upon to leave for a while: trust, friendship, willingness, and an absence of rigid regulations and formality; and meantime, while I (as well as hundreds of others like myself) am absent, the future of medical practice is being discussed and planned and plotted." Later on he suggests that the return of absent practitioners be awaited before anything is decided upon: "If State medicine must come, then those already in a State service should be given the chance of assessing what their life will be like in an alternative service."

I give my whole-hearted support to the points expressed in that letter. Generally speaking, the majority of the letters and articles published during the last 10 months either support a State Medical Service or suggest various schemes for medical practice after the war, presumably taking for granted that State control will be in. For example, in the earliest number I have with me, June 28, 1941, there is an article headed "Medical Planning Research: Manifesto by the 'Younger Half'." It is, granted, a wide and comprehensive survey of the many problems to be tackled, but it assumes that the State will have a large measure of control, and apparently the 48 signatories to that letter are willing to have such control. I would like to know how many of them at the time of writing that letter were in the armed Forces, and how many of them had had experience of State control as it can be. In the *Supplement* of January 3, 1942, there is a letter from the Secretary of the B.M.A. which was sent to the honorary secretaries of Divisions throughout England, Scotland, Wales, and Northern Ireland, suggesting that Divisions organize themselves into groups for the consideration of the future of medicine. Here again the medical man who is at present with the Forces was sort of "missed out."

I have had many talks with medical officers about State control, and I know that among the "hostilities only" medical men even the possibility is regarded with some apprehension. An R.A.M.C. friend of mine writing from abroad said: "No financial security, no regular hours, nothing is worth the sacrifice of soul which would be entailed. We should all have to be 'Yes-men' to administrators, lay people, senior officers in the State service, and the most affirmative 'Yes-men' would get the jobs." I put forward a plea, which I am sure will be echoed by the great majority of doctors who, like me, are temporarily with the Forces, to put on the brake, strongly, and stop this precipitous rush towards State medicine.

The medical profession must think well and deeply, especially the younger members, before plunging into a State service. Could any financial security, regular hours of work, etc., compensate for being a "junior officer" in the State service, with its resultant loss of initiative, continual referring upwards for approval, perhaps not even to other medical men, having to account for every halfpenny spent on drugs, etc., being in such a position that the disapproval of an immediate superior could spoil one's chances of getting some particular appointment that one wants, having to take holidays after others have had the pick of the season, because one is the "junior officer," and not arranged by mutual good will as at present in the firms as we know them? Are the "pros." of State medicine worth the sacrifice of liberty, the freedom to resign from a job one does not like, the choice of where one works, the choice of under whom one works, and of the type of medical work one does? Are they worth having the knowledge hanging over one like a cloud that every so often a report on one's work is sent up to some central administrative body or other by an immediate superior, and on that report promotion may depend?

I am convinced that those upholders of State medicine will refuse to believe that such disadvantages could possibly arise, but arise they would as inevitably as the coming of the triplicate form, the "leave-chit" for holidays, the expenses and allowances forms, and endless other forms and amendments which any county M.O.H. can tell you about: all this culminating in the slow, steady, soul-destroying progress upwards if one was "a good boy."

I would like to finish by reminding the medical profession that for the duration of the war they hold the future of medical men in the Services in their hands. It would be grossly unfair if any radical changes came *in* before we were *out* and able to give all our attention to the very great problems confronting the profession, which will affect us for many more years to come than the majority of those at present in civilian life.—I am, etc.,

PETER WALTON,
Surg. Lieut., R.N.V.R.

National Eye Service

SIR,—The recent letter from the secretary of the National Ophthalmic Treatment Board announcing the postponement of the application of the new scale of charges which would have been operated on July 1 will, I am afraid, cause much heart-burning among all ophthalmic medical practitioners, including ophthalmic surgeons. However, they must not be discouraged, for the threat of lay organizations to withdraw their support from the National Eye Service could not have come at a more opportune moment, for the following reasons:

1. The ophthalmic medical profession is probably more united to-day than ever before, thanks to the recent generous action of the B.M.A. in granting to the Association of British Ophthalmologists the privilege of having two observers on the Ophthalmic Group Committee, and it is also significant that one A.B.O. member is on the National Ophthalmic Treatment Board.

2. The proposed new scale of charges was well supported by ophthalmologists and was so reasonable that it was approved by the B.M.A. Council.

3. The reasons for the postponement are so unconvincing that those who meet the representatives of the dissatisfied parties should have no difficulty in making them realize the justice of our claims, although the unwillingness of approved societies to part with their accumulated funds may result in our having to collect the extra 10s. 6d. from those in the new insured group ourselves, most of whom, it must be remembered, previously paid full fees or at least a guinea fee, and in any case will not qualify for ophthalmic benefit for some time.

4. It is inconceivable that the Government will permit approved societies to delete the National Eye Service from the methods whereby their members entitled to ophthalmic benefit obtain it.

5. The present prosperity of the workers and almost complete absence of unemployment will result in a greater demand for the service.

6. Thanks to the foresight of our leaders in introducing the National Eye Service at a time when few appreciated the necessity for meeting the needs of the less fortunate members of the community, we are now dealing with a greater proportion of the population than ever before, for school children, members of the Services, those called up under the Registration for Employment Order, and not a few members of the Civil Defence, are being referred to us.

Many will agree that the National Eye Service can be improved to meet the changes which are rapidly taking place, but its present popularity has more than proved that it can be made the basis of a truly national eye service. Indeed, a step has been taken recently which will meet an old-standing objection on the part of approved societies, which should encourage those with grievances to submit them for consideration.—I am, etc.,

Liverpool H. RICHARD BICKERTON.

Ophthalmic Medical Service

SIR,—May I draw the attention of our colleagues to the following points. It has been so often stated, both in public and in private talks, that there are not enough medical men trained to do eye work in the country to meet the needs even of the insured public that some of us have almost begun to believe it. I venture to submit that it is not so on the following grounds.

To save the effort of unnecessary calculations for anyone who is interested I use round figures and also make the maximum allowance for views other than our own. The total population of the country may be taken to be fifty millions, and we can exclude from our calculations all school children—say, ten millions—because they are cared for by the local authorities. It could also be accepted that most of the school medical officers are not on the B.M.A. list of approved ophthalmic medical practitioners. Thus we have to provide ophthalmic medical service for forty millions. Incidence of errors of refraction is about 10% at the most of the adult population. Hence four millions out of forty have to be catered for for defective sight. It is not unreasonable to suggest that on an average each one of these four millions will require change of lenses once every four years. Thus, at the maximum, even if the whole adult population of Great Britain were provided with specialist ophthalmic service every year, a million patients will have to be dealt with. Though there are about 1,000 ophthalmic medical practitioners on the B.M.A. list, taking into consideration wartime conditions and other objections I will count for my argument that only 500 are available to provide this service, and by a simple calculation we arrive at the figure of 2,000 to be seen by each in the course of a year. If we take 300 working days out of the 365, each ophthalmic medical practitioner will have to attend to about 7 to 8 patients per day. Hardly anyone would argue that this would be working him too hard, and he would be left with enough time to attend to patients suffering from diseases of the eye and to operative work.

Therefore, I request my colleagues not to allow the statement on the number of ophthalmic medical practitioners to pass unchallenged. The real problem is poor distribution of practitioners and dispensers, which can only be remedied by deliberate and systematic planning and not by *laissez faire*.—I am, etc.,

Doncaster. M. D. THAKORE.

Free Choice and Goodwill

SIR,—Many will agree with the views of Dr. Cockshut (*Supplement*, June 27, p. 98) that free choice is incompatible with a salaried State service and with his pessimism concerning compensation for loss of goodwill. A post-war general practitioner service will probably be an extension of the present system, as recommended by the majority of the Medical Planning Commission. There are many good reasons for having it so, but as health schemes will continue to be limited by financial considerations during the period of national poverty which lies ahead, cheapness is likely to be the deciding factor with politicians. The panel system, or some modification of it, will provide the greatest health of the greatest number combined with the greatest economy.

In the unlikely event of medicine as a business being completely replaced by medicine as a social service, one must be sceptical about compensation being granted for loss of capital. A claim for such would meet with the greatest resistance. Socialization in the form of free clinics of various kinds has progressed insidiously during the past 20 years without any compensation whatsoever.

The amount invested in goodwill is a capital sum which doctors for generations have calculated on realizing on retirement as they realize a capital sum on the maturity of a life policy. When goodwill is bought by instalments out of profits over a number of years, doctors have hitherto been right in believing that they are thus investing money. A practice built up *ab initio* also has a capital value, the sum realized on transfer compensating for the lean early years and the outlay on education. Pensions, if granted, might not suffice in many cases to compensate for loss of capital. They should rather be regarded as part of remuneration for work done. In no Government service does pension ever represent return of capital.

It would be grossly unfair if the business side of medicine were selected as being suitable for a process of even partial confiscation, while other capitalist enterprises were left *in statu quo*. The subject is of sufficient importance for the B.M.A. to have its views formulated well in advance.—I am, etc.,

Glasgow. J. N. JAMIESON.

War Damage Insurance

SIR,—It is easy to be wise after the "blitz," especially when one has learnt one's lesson at some cost. To my surprise I found that I and nearly all my colleagues in Bath had committed the same errors of either inaccurately or inadequately insuring our effects against war damage. Medical men are notoriously bad at business, but it seems to me that there must be some fundamental confusion as to what the War Damage Act, 1941, means for the medical profession. There was an editorial in the *Supplement* of Jan. 17, 1942 (p. 10), giving details of war damage insurance, but even that I submit was not sufficiently lucid. Moreover, and this is important, the insurance companies, usually so helpful in effecting other types of insurance, are not interested in war damage insurance.

Under the business scheme, which affects every medical man other than salaried officials, there are three groups. The first concerns those whose equipment, motor car, etc., do not exceed £100 in value. That group, which must be very few in number, may insure voluntarily under the private chattels scheme. The second group concerns those whose equipment, motor, etc., exceed £1,000 in value. Such a group will include radiologists and other similar consultants. They *must* insure under the business scheme, and to the full market-value: not to do so is an offence and penalties may be imposed for non-compliance. The third group, which concerns the majority of medical men, comprises those whose equipment, motor car, etc., are between £100 and £1,000 in value. The Act states that insurance for this group is voluntary. This is misleading because, in fact, unless insurance to the full value of *all* the above-mentioned articles is effected, and any one of them be damaged, the Board of Trade will apply "average." To illustrate this point I give two examples:

"X" insured his car for £100, its value, but not his surgery furniture or drugs, value £400. The car was a total loss, whereas the surgery furniture and drugs were undamaged. The Board of Trade applied "average," and instead of paying £100 for the loss of the car settled the claim for only

$$\frac{100}{100+400} \text{ of £100=£20}$$

"Y" insured his car for £100 when its value was £200, and his surgery furniture and drugs for £400, half their value. All were lost. The Board applied "average" and he will receive only £250, and not £500.

Thus, for insurance to be completely effective, the business equipment, including car, should be insured for their full market value less depreciation. It is important to note this "market value." A desk which cost £25 ten years ago may now have a market value of £50 owing to the increased cost of furniture. Therefore the desk should be insured for £50 less such amount as it has depreciated in ten years of use. Incidentally, waiting-room furniture must be included under the business scheme. Where the waiting-room, however, is used as a dining-room a piece of furniture such as a sideboard might be included among the private chattels, and a canteen of silver should certainly be so included.—I am, etc.,

G. R. P. ALDRED-BROWN.

Married Women Doctors

It has recently been reported to the Central Medical War Committee that there are a number of married women doctors who are at present fully occupied with household duties and who could, if the necessary domestic help were available, be freed for medical duties. The committee will be prepared to take up with the Ministry of Labour the case of any married woman practitioner so situated, and particulars should be sent to the Secretary, Central Medical War Committee, B.M.A. House, Tavistock Square, W.C.1.

H.M. Forces Appointments

ROYAL NAVY

Surg. Lieuts. P. O'Brien, G. T Holroyd, W V. Owen, R W. Duncan, J. Robertson, P. J. O'Meara, K. J. O'Connor, and E. B. Martin have been transferred to the Permanent List

ROYAL NAVAL VOLUNTEER RESERVE

Surg. Lieut. E. Laidlaw-Thomson, S S.R.N V.R., has been transferred to R N V.R., in rank of Temp Surg. Lieut. (Substituted for the notification in the *London Gazette* dated May 15, 1942.)

Prob. Temp. Surg Lieuts. W. J. J. Breakey, W. J. Knowles, R. R. Dickson, W. B. Dawson, A. A W Beach, J. M. McAlpin, and W. G Rees to be Temp. Surg Lieuts.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

D S Stevenson, M.B.E., to be Lieut., and is granted the acting rank of Col.

War Subs. Capt. E. A. I. Phillips has resigned his commission and is granted the rank of Major

War Subs Capt. O. H. Mavor has relinquished his commission and is granted the rank of Major.

War Subs. Capts I. G. Briggs and J. D Benjafield have relinquished their commissions on account of ill-health and are granted the rank of Major.

War Subs Capts C. M. Wells, A. M. Coondoo, B. D. Merrin, and R E. G Smith have relinquished their commissions on account of ill-health and are granted the rank of Capt.

War Subs. Capts. J. Laughlin, J. R. Winter, F. H. McKenna, and J. D Philp have relinquished their commissions on account of ill-health and retain their rank.

War Subs Capt W. S. Ormiston has relinquished his commission on ceasing to be employed.

War Subs. Capt T. C. Sato has relinquished his commission on account of ill-health and is granted the rank of Capt (Substituted for the notification in a *Supplement* to the *London Gazette* dated June 12, 1942.)

Lieuts. C J. B Anderson, J Scott, J. Vine, S R Adlington, and J Tobin have relinquished their commissions on account of ill-health and retain their rank.

Lieut C. H. Smith has relinquished his commission.

The surnames of Lieuts. S. K Squires and W. Phillips are as now described and not as stated in *Supplements* to the *London Gazette* dated Jan. 27, and May 1, 1942, respectively.

To be Lieuts: F. Bernstein, J. T. D. Clark, J. Clark, W. B Clark, A. Bromley, J. Cowan, A. S. Craner, E. Cronin, G J. Cunningham, D. Davidson, J. Fine, S Gordon, C. H. Goldmann, C. L Greenbury, M W Grunstein, F. Gugenheim, F D. Hark, C R. Harris, R. V. Havard, W. Hobson, D. W. M. James, R. V. Jones, J. W. Litchfield, P. E. McKernan, I. McPherson, J T. Marr, W. Malone, D Menzies, L. G J. Pitt-Payne, R. K. Price, D Rooney, R. G. W Southern, H. E. Seingry, M R Thompson, A B Unwin, T. de L Walker, B. E. Welton, A. Wood, P. Wiles, E. D. Lindow, R. Collins, P. G. Roberts, M W Annear, W. G. Barrie, C. C. Beresford, A. K. Bingham, L. Brill, C H Brown, J. C Brownlee, W. P Clothier, J. H. Colhoun, D L. Davies, R. I. S Dunn, J. H. Haldane, J. A. V. Hamilton, E. Isaacson, J. S Jeffrey, G. Jelinek, G Johnstone, C. Jones, E. H. Jones, N. B. Jones, J. M Lees, H. Levin, W. B. Lipschitz, J. Littlewood, C. Mackenzie, A. G McLeod, N. F McLeod, R. McIlwraith, J. H Molloy, S. H. Martin, G H Waddington, I. T. F. Wiley, N. F Winder, W W. Yellowlees, T. E. Broadbent, T. A. Berry, J. F Birrell, C. A Borland, J. W. M. Christie, R. Coleman, M Diamond, M. E. Disney, R K. Dowson, G B. Gibson, T. E. Hall, J. M Hamilton, G. J Harrison, R. N Herson, W R. C. Lang, D. Macdonald, H. Mathers, J. McI. Megaw, A G. B. Miller, H H. Miller, J. E. Milne, C L. Owen, G. H Pimblett, L J. Prosser, E. G G. Rhind, T. R. A. Richmond, R. P. J Rutherford, M. Sarwar, J. P. Sharp, J. F. Sheehan, H. M. S. Stanley, J. S. Stevenson, F. J Swinton-Esher, D. O. Walker, H. Willcox.

ROYAL AIR FORCE

Air Vice-Mshl. (Temp Air Mshl) Sir H. E. Whittingham, K B E, K.H P, to be Air Mshl.

Group Capt H L. Burton, K H.P., to be Air Cdre.

The following Consultants have been promoted to the acting rank of Air Commodore. Group Capts. A. F. Rook, O.B E., J J Conybeare, M.C., C. P Symonds, G. L. Keynes, P. A. Hall, P. C Livingston, O B.E., A.F C., E. D. D. Dickson, R. R. Macintosh, and Wing Cmdr. S. Cade.

Group Capt. D'A. Power, M.C., to be Air Cdre. (Temp)

The following Group Capts (ret.) who have continued to be employed on the active list in their present rank now relinquish that rank at their own request and assume that of Wing Comdr.: R. A. G. Elliott, R. J Aherne, M.C., T. Montgomery.

Squad Ldr S. B S Smith to be Wing Cmdr. (Temp).

To be Medical Officers (Emergency) with the relative rank of Flying Officer for employment with the R.A.F: The Hon. Phyllis L. F Acland-Hood, Miss Alison B. Cruikshank, Mrs. Mary S T. Logan, Mrs. Phyllys P Pigott, Mrs. Eveline M. D. M. Scott, Miss Winifred J. Symington, and Miss Kathleen E. A. Smith (promoted to the relative rank of War Subs Fl. Lieut).

RESERVE OF AIR FORCE OFFICERS

Squad Ldr F. I G Tweedie to be Wing Cmdr. (Temp).

Fl. Lieuts E A. Mayston and J H. L Newnham to be Squad. Ldrs (Temp).

ROYAL AIR FORCE VOLUNTEER RESERVE

Squad Ldr. J Wingate to be Wing Cmdr. (Temp)

Fl. Lieuts K F Caird, W. A. S Falla, H. A. Tracey, R G. H Cunningham, W. Hargrave-Wilson, C R. Jenkins, E B Rayner, G. P Arden, J G. McC Browne, W. H. Gossip, L. S. Henry, J. C. McGregor, D. M. Wallace, C. R Mayou, I B K MacGregor, W. Simpson, R. E. Angel, D M. Brown, R H. Craig, C Hotson, T. S. B Kelly, J. B. Maurice, G. MacK Gibson, B. J E. Anson, H S Atkinson, P R. Kemp, H. S. H. O'Conor, R. W Stewart M L. Maley, H. E. Pooler, B S. Robertson, K. W Bruce, D. G. Evans, G B Grayling, F. G. Mundell, J. H. Hall, H. J. Davies, D M Hannah, R Hill, A. Wilson, H. J H Hendley, J. B Methven, F. R Neubert, J. D. Ramsay, D. Skinner, T C. Wilson, J Courtney, L. G Anderson to be Squad Ldrs. (Temp.)

A Bowen-Davies to be Squad. Ldr (Emergency)

Fl Lieut. A K Thomas has resigned his commission and retains the rank of Squad. Ldr.

To be Fl Lieuts (Emergency). P. M Kelly, R C Browne, H A. Mackenzie-Wintle, C F. Price, S Stanford.

Flying Officers I L. W. Clancey, P Citron, C W. Hutt, J K Swanston, I W. H R. Cran, D S Grant, S. Duff, G. O Rosenvinge, R. W. Grayburn, I D Macintyre, H A Rowley, D. W. R. Ashby, W Cookson, E W. Somerville, S M Rigg, W. S Pitt-Payne, D. E. Mitchell, E. F Burton, and R A Trevethick to be War Subs Fl Lieuts

WEEKLY POSTGRADUATE DIARY

BRITISH POSTGRADUATE MEDICAL SCHOOL, Ducane Road, W.—*Daily*, 10 a m. to 4 p m, Medical Clinics, Surgical Clinics and Operations, Obstetrics and Gynaecological Clinics and Operations *Daily*, 1.30 p m., Post-mortems *Tues.*, 10 a.m., Paediatric Clinic; 11 a.m., Gynaecological Clinic. *Wed.*, 11 30 a m, Clinico-pathological Conference (Medical); Pathology of Diseases of the Breast, Prof. J. H Dible *Thurs*, 2 p.m, Dermatological Clinic. *Fri.*, 12.15 p m, Clinico-pathological Conference (Surgical); 2 p.m., Clinico-pathological Conference (Gynaecological); 2 p.m, Sterility Clinic.

ROYAL NATIONAL THROAT, NOSE AND EAR HOSPITAL.—*Fri.*, 4 p m. Mr. F C Ormerod: Bronchoscopy for Neoplastic and Inflammatory Diseases of the Chest.

DIARY OF SOCIETIES & LECTURES

ROYAL SOCIETY OF TROPICAL MEDICINE AND HYGIENE, 26, Portland Place, W.—*Thurs.*, 4 30 p m., Annual General Meeting; 4.45 p m, Paper by Col Sir Rickard Christophers: The Treatment of Malaria and Some Points about the Drugs in Use against this Disease. A discussion will follow.

B.M.A.: Branch and Division Meetings to be held

KENSINGTON DIVISION.—At British Postgraduate Medical School, Ducane Road, W, Mon, July 20, 8.30 p m General meeting to continue discussion of Interim Report of Medical Planning Commission.

SHROPSHIRE AND MID-WALES BRANCH.—At Royal Salop Infirmary, Tues, July 21, 3 30 p.m. General meeting. Agenda: Report of Branch Study Group and consideration of Medical Planning Commission's Report All practitioners in the area of the Branch are invited.

SOUTH-EASTERN COUNTIES DIVISION.—At Royal Hotel, Galashiels, Sun., July 19, 2.30 p m. Consideration of Report of Medical Planning Commission.

BIRTHS, MARRIAGES, & DEATHS

BIRTH

MAHER.—At Dingle Nursing Home, Birmingham, on July 9, 1942, to Veric (*née* Howie, M.B., Ch.B. Glas), wife of Dr. John P. Maher, a daughter (Elizabeth Ann).

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY JULY 25 1942

PLANNING FOR GENERAL PRACTICE

BY

F. W. GRANT, L.R.C.P.&S.Ed.

Planning the post-war world is the fashion of the moment. It is perhaps only natural that those of us whose duties leave us enough energy and leisure should devote some thought to the sort of world that ought to be the outcome of those ideas for which we are fighting. In doing so it is very necessary to remember certain important conditions.

The crusading spirit engendered by war gives the ideologist and the faddist an opportunity for persuading us to accept criticisms of ourselves and ideas for our reformation which in ordinary times we would view with suspicion if not with disfavour. (The prohibition laws of the United States are the classic example.) In addition those of us who are engaged in planning are doing so while the majority of the profession are too busy to do anything but live from day to day, and the time will come when that majority will claim the right to plan the world they have won. My only excuse for discussing the subject is that I am a general practitioner in a poor community and have a first-hand knowledge of the type of practice that has been most criticized.

The Standard of Practice

It is a fair assumption that the poor and the near-poor do not get the same quality or quantity of medical attention as those who are better off, and that the standard of practice tends to be less good in proportion to the poverty of the community. This generalization is equally true of feeding, housing, or of anything else that costs money. I would prefer to put it that, beyond a certain point, the quality of a doctor's work tends to vary inversely with the quantity of work he has to do to earn a reasonable livelihood. It is only fair to point out that the service given to nearly one-half of the working classes is provided under the National Health Insurance Act and that the standard of pay which, it is alleged, determines the standard of work is that deemed adequate not by the profession but by the State.

It has been asserted that a doctor ought not to have to compete with his colleagues for income, for patients, for advancement, or for appointments. Competition—which is, after all, the executive manifestation of ambition, with the prize, whether it be patients, money, a university chair, or a laurel wreath, as the outward and visible sign of achievement—cannot be altogether evil provided it be honest. To compete for patients by trying to do better work than one's neighbours is surely less undesirable than to compete for promotion by seeking the patronage of one's administrative superiors. It is interesting and relevant to note that the Soviet Union, in spite of its basic philosophy, has been compelled to foster the competitive spirit and reward merit and diligence.

At this point it is necessary to consider what we want to achieve in our ideal service. It would provide every citizen with that quantity and quality of medical service which is necessary for his welfare, quite irrespective of his ability to pay for it, and would provide that service in the form most acceptable to him. In discussing these matters we have lately been prone to think of our patients collectively as "the public" or "the nation," and have been apt to forget that clinical medicine is concerned with persons and not with communities.

The patient wants a doctor in whose personal skill he has faith, and who will not only treat him to the best of his ability but will be a sort of medical tutor or mentor who will give him unbiased advice, based on a first-hand knowledge of the patient himself and of his environment, on health matters and on all sorts of things that have only a remote bearing on health. Particularly in poorer districts, he wants to feel that he has access to someone who will interpret and, if necessary, censor the advice given by clinics, hospitals, and consultants or through propagandist channels. I think he also wants to be the doctor's employer, to have the right to criticize him and to give effect to that criticism by transferring his custom elsewhere. For all this he is willing to pay, so far as his means allow, by any method which does not entail large and unexpected calls on his purse.

General practice differs from the other branches of medicine. It is much less of an objective science, and more of an art that is in large part subjective in so far as it depends for its success in contributing to the welfare of the patient upon a proper doctor-patient relationship that is best promoted by continuity of service and by a close knowledge of all the environmental influences on the patient's life. The good general practitioner desires that nothing should be done to disturb that relationship.

Nobody ever takes up general practice either to have an easy life or to make a fortune. All the doctor wants is a competence that will include provision for his old age or will be sufficient to enable him to make that provision for himself. He, quite rightly, wants his remuneration to bear a definite relation to his industry, skill, and experience. He would much prefer to have the opportunity of working in a well-equipped clinic where he would have the benefit of constant association with his colleagues. Lastly, he would value any opportunity of post-graduate study, which at present must take the place of part of his scanty leisure.

The administrator, whose function it is to direct, co-ordinate, and supervise, requires that the service should be efficient and that he should have the machinery to maintain that efficiency.

There are, in general, two methods of conducting a reformation—the totalitarian and the democratic. The former sweeps away the past completely and starts afresh; the latter, the usual British method, retains what seems to be good as a foundation for the future. Both these schools of thought are represented in medical planning by two main schemes.

The Salaried State Service Scheme

The first scheme is to abolish private practice and to put in its place a salaried service conducted by the State. Such a scheme has much to commend it. To the administrator it offers an organization which by reason of its compactness would be easy to control provided it was possible to obtain and maintain an adequate staff: to the patient it offers an adequate service from the scientific point of view (not necessarily better than or even as good as he could get from the alternative scheme) while taking away, in large part, his present advantages of privacy and free choice: to the doctor it offers a safe job with a settled income and a pension for his old age. It is alleged by the sponsor of this method that the patient no longer values the privilege of free choice; but the evidence for this is mainly presumptive, while the evidence to the contrary is not only more abundant but is, moreover, factual. No system can reduce night work and other non-routine calls on the doctor's time, nor is it possible to avoid the necessity for arranging consulting hours to suit the working hours of the patient. The total amount of work cannot be reduced, and if the number of doctors remains the same the average amount of work per doctor will not diminish.

The terms of service suggested are not unreasonable, although they have the disadvantage that the maximum would not be reached until after the practitioner had passed the peak of his earning power and the period of maximum personal expenditure. There is no guarantee that these terms would be obtained or maintained. In arriving at a proper remuneration any Government must to a certain extent be guided by precedent, and the precedents should be examined.

At national health insurance rates a practitioner can earn a net income of £1,000 a year (by 1938 standards) by making an average of 50 attendances a day throughout the year, with a peak load of over a hundred in busy times Is this a reasonable amount of work? Would any Government pay a salaried service at any higher rate than this, or would this be the basis of the salary scale without any private and club practice to subsidize it?

The fighting Services offer a career almost on a parallel with a salaried general practitioner service, and yet they have difficulty in filling vacancies in peacetime. How many officers surrender their pension and other rights and enter private practice with all its drawbacks? The school medical service gives all the advantages of the proposed scheme; but still school doctors leave to buy a practice, often with borrowed money.

The position of the medical profession in a salaried service would be analogous to that of the teaching profession. Teachers should have the most liberal of educations and should be paid for their learning; but the State in order to get cheap labour catches them young, gives them a narrow education in mass-production colleges, and pays them, in default of any competition for their services, a wage that would be scorned by many a day labourer. As a result, after half a century of State control, teaching, which should be one of the highest of the arts, has become the scullion of the professions.

A Scheme Embodying N.H.I. Features

The second method of reform is to embody the better features of national health insurance practice, with 30 years of experience behind it, in a scheme to provide a good service either for the whole population or for that section of the community which cannot afford to pay for it in the present way. The advantages to the patient are that he may choose his own doctor, that he is assured of continuity of interest and of treatment by the same doctor, and that he is the doctor's employer. The weakness of the present system, from the patient's point of view, is that transfer from one doctor to another is unnecessarily complicated by regulations which spread out the process to a period of from one to four months and which were not made in the interest of the patient or of the doctor. To the doctor the scheme offers the advantages of being free to practise where he pleases, of choosing the patients he will attend, of being able to concentrate his attention on the patient without being distracted by the administration, and of having a definite incentive to foster a proper doctor–patient relationship.

The weakness of national health insurance practice lies in its financial provisions. The value put on our services is too low, and tends to force us to reduce our standards of practice to enable us to earn a livelihood. This weakness cannot be compensated by the provision of pensions, because it has to be remembered that pensions would have to be earned and paid for by a reduction in income during our earning years. There is no essential difference between subscribing to a superannuation scheme and paying premiums to an insurance company. The system has another defect in that it makes no provision for any financial recognition of skill and experience.

The administrative mind is inclined to jib at this solution because of that bugbear of democratic reform, administrative difficulties. This argument should carry very little weight, as it is time we learnt that administration, while its function is to direct and supervise, should always be the servant of the organization and never its master, and that to put up with the second-best because the best cannot be administered is not an evidence of wisdom but an admission of incompetence.

General Considerations

Before coming to a decision as to the best method of planning the profession there are several more general considerations to be remembered. In a letter in the *Supplement* of Nov. 1, 1941 (p. 87), Sir Henry Bashford called attention to the fact that where a perfectly good free service was provided a certain number of those concerned were always dissatisfied and, at their own expense, made their own arrangements. What would happen to these if there was a complete State service with no free doctors to whom they could go? Is it possible that they might be so misguided as to express their freedom by seeking advice from quacks and patent-medicine vendors, some of whom are considered now, even by well-educated people, to be more skilful in certain respects than orthodox practitioners? We can be sure that the charlatan would do his best to exploit such a revolutionary change in our status.

Can the average medical man be a good Civil Servant and at the same time a good practitioner? In an organization employing forty or fifty thousand people it is necessary that, so far as possible, every occasion should be governed by rule or by precedent and that a new precedent should be established only with the consent of higher authority. How can that be squared with the fundamental axioms of medicine—that the patient is the prime consideration and that the rule must be conditioned by the occasion? In this connexion it is interesting to note the leading article in the *Journal* of March 7, 1942 (p. 330), in which, in dealing with war neuroses treated by the E.M.S., it is stated: "If we cannot wholly exclude psychoneurotic and psychopathic individuals from the Services, we can at least avoid manufacturing neuroses or making them worse. . . . There is a habit . . . of delaying diagnosis unnecessarily long by the modern tendency to rely less and less on 'clinical sense and clinical science' and more and more on laboratory techniques. This seems to be a liability of the bureaucratic type of organization. From fear of committing himself to a diagnosis . . . the medical officer asks for more and more tests and tries to pass the responsibility on to someone else." Anyone who treated the neurotics of the last war will remember how treatment was hampered by the tenacious clinging of the patient to his Service label of "shell-shock," "neurasthenia," etc., and how he was obsessed by the ritual compilation of his dossier to the exclusion of his common sense. If this is an inherent defect of State medicine it ought to be a factor in arriving at the solution of our problem.

As our planning is to be for the future we should consider what would be the likely results of a complete change on the manning of the profession. It is quite certain that many of us, and these not by any means the least efficient, would never have chosen a career which promised nothing better than a safe job with a "wage-for-age eight-hour-day double-pay-on-Sundays" outlook. How many of the giants of the past or present would, or could, have worked as doctors in a State service; and, if they had, how many would have been dismissed for insubordination or for taking unjustifiable risks? The pioneer of medical progress must begin by being a sceptic and a heretic. Is there a place for the heretic in a State service? Will the prospect of a safe job, in which security is paid for by a definite limitation of opportunity, attract the type of mind that is necessary to the first-class doctor? Even if it does, will not a life governed by convention, rule, and precedent, with their stifling influence on initiative and intelligence, so alter the outlook as to turn a good doctor into a merely average one or an average one into a poor one?

It is not so very long, as time goes, since as barber-surgeons, leeches, and apothecaries we were mere lackeys. By our own exertions we have gained a place in society. Our opinions on medical and social matters are respected, largely because of our political independence. We take our full share in public affairs, both national and local. We provide more than our proportion of Members of Parliament, besides serving on local authorities, education committees, health committees, and other social bodies. If we accept or have imposed upon us a salaried service we will virtually be disfranchized. We shall only be able to express our opinions when they are not at variance with those of our Department, which in turn must take them from the party in power.

Self-criticism is a salutary exercise, but we must avoid adopting a self-deprecatory and pseudo-objective outlook which will lead us to understate our achievements, to underrate our value to the community, and to exaggerate local and individual weaknesses into general indictments of the whole system. We should refuse to accept without a struggle any plan by which our profession becomes a political instrument, our advances an item in election addresses, and our failures a whip wherewith statesmen may scourge one another, while we ourselves are relegated to the obscure mediocrity of anonymous cogs in a State machine.

POSTGRADUATE NEWS

A series of postgraduate lectures in ophthalmology has been arranged by the Department of Ophthalmology of the University of Glasgow and will be given on Wednesdays, Sept 9, 16, 23, and 30, and Thursday and Friday, Oct. 1 and 2 Details will be published in the postgraduate diary column of the *Supplement* week by week.

WEEKLY POSTGRADUATE DIARY

BRITISH POSTGRADUATE MEDICAL SCHOOL, Ducane Road, W—*Daily*, 10 a m to 4 p m, Medical Clinics, Surgical Clinics and Operations. Obstetrics and Gynaecological Clinics and Operations *Daily* 1 30 p m. Post-mortems *Mon*, Course on Special Problems in Wartime commences *Tues.*, 10 a m, Paediatric Clinic; 11 a m, Gynaecological Clinic. *Wed*, 11 30 a.m, Clinico-pathological Conference (Medical); 2 p m, Bacteriology of Pneumonia, Dr Mary Barber *Thurs*, 2 p m, Dermatological Clinic *Fri.*, 12 15 p m, Clinico-pathological Conference (Surgical); 2 p m, Clinico-pathological Conference (Gynaecological); 2 p m, Sterility Clinic.

EDINBURGH POSTGRADUATE LECTURES—At Edinburgh Royal Infirmary, *Thurs*, 4 30 p m Dr Andrew Davidson. The Contribution of the E M S to Medicine and Surgery in Scotland

DIARY OF SOCIETIES & LECTURES

BRITISH DENTAL ASSOCIATION, 13, Hill Street, W.—*Tues*, 3 p m Mr C. Bowdler Henry Complications and Treatment of Impacted Wisdom Teeth.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W—*Mon*, 5 p m Third Lettsomian Lecture by Dr Anthony Feiling: Epilepsy.

Branch and Division Meetings to be Held

KENSINGTON DIVISION—At British Postgraduate Medical School, Ducane Road, W, Mon., July 27, 8 30 p m General Meeting to continue discussion of Interim Report of Medical Planning Commission

ROCHDALE DIVISION—At Rochdale Infirmary, Sunday, July 26 Meeting of all practitioners in area of Division to consider Interim Report of Medical Planning Commission.

BIRTHS, MARRIAGES, & DEATHS

BIRTH

LEIGH—On July 10, 1942, at Sevenoaks, to Pamela (*née* Parish), wife of Capt. A D Leigh, R.A.M C, a son.

DEATH

FOSTER—Accidentally drowned on March 26, 1942, whilst serving with the R.A.M.C., Middle East Forces, Lieut. Eric Mace Foster, only son of Mr. and Mrs. S. M Foster, 9, Grange Road, West Bromwich

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY AUGUST 1 1942

THE B.M.A. AT WORK

EXECUTIVE DECISIONS

A meeting of the Executive Committee of the Association was held on July 15 under the chairmanship of Mr. H. S. Souttar. In addition to the members of the Executive, the chairmen of four standing committees whose business came forward were invited to attend. A satisfactory account of the finances of the Association for the first four months of this year was given by the Treasurer (Dr. J W. Bone). Subscription revenue shows a large increase over the corresponding period of last year.

A request was considered from several members of the Ophthalmic Group that a re-election of the Group Committee should be held. The Executive decided that re-elections of all Group Committees shall take place as soon as the Annual Representative Meeting is over. The Groups, of which there are nine, held their last elections mostly in 1938. Some fresh nominations were made to the committee recently set up to consider Association machinery, certain of those first nominated finding themselves unable to serve. On the request of a member of the Association, the Executive considered again the Council's decision that alien doctors who have been admitted to restricted registration are not entitled to membership of the Association, though they may obtain the *Journal* at a reduced subscription rate. After discussion, however, the Council's decision was reaffirmed.

The Medical Schools

A committee was recently appointed by the Minister of Health and the Secretary of State for Scotland to inquire into the organization of medical schools, particularly their facilities for clinical teaching and research. This committee has forwarded an invitation to the Association to give evidence, especially as to the desirability and method of linking voluntary and local authority hospitals for the purpose of medical education, the selection, appointment, and payment of the medical staff of hospitals so linked, the extent to which teachers in the clinical period should be appointed on a salaried basis, the assistance of general practitioners in the training of students, the facilities desirable for house appointments for recently qualified practitioners and for refresher courses for general practitioners and courses for postgraduate students specializing in a particular branch of medicine, and, finally, the number of practitioners who may be needed after the war. The Executive set up a representative committee to consider the evidence to be tendered, the committee including a number of members prominently identified with medical teaching outside as well as inside the councils of the Association.

A request was also received from medical students. Hitherto medical students have been represented by a subcommittee of the National Union of Students; this has not been very satisfactory in practice, and the British Medical Students' Association has now been set up to include all the students in the London and provincial medical schools. From this new body a letter was received expressing eagerness for close co-operation with the British Medical Association in matters of common interest and the hope that the latter would recognize the value of an independent representative organization which would present the students' point of view. It also appealed for a contribution to cover initial expenses, not exceeding £100 in the first year. The Executive welcomed the formation of the new body and cordially acceded to its request, also agreeing to the use of the House for its meetings and the part-time services of a clerk when necessary.

Prisoners of War

Through the hon. secretary of the Preston Division a letter was received from a captain R.A.M.C. who is a prisoner of war in Germany. Incidentally the letter stated that the writer had received the *Journal*, and as he was the only one of 12 medical men in his camp who did receive it there was a good deal of competition for its use, and the articles on State medicine in particular aroused great interest and discussion. The letter went on to suggest that the Association might do something to help prisoners of war, particularly by sending out to them necessary reference books and recent publications. The Executive on receipt of this request instructed the Secretary to endeavour to discover exactly what was wanted, and empowered him to take whatever steps were possible to meet the need. It made available a sum of money for the purchase of books for prisoners of war.

It was also agreed to take such further opportunity as offered for making the hospitality of the Association House available to medical officers of the American and other Allied forces in London.

The Executive adopted a recommendation from the Charities Committee to allocate contributions received by the Charities Trust Fund, unearmarked, during the first half of the present year, as to £1,000 to the Royal Medical Benevolent Fund and as to £1,000 to the Royal Medical Foundation of Epsom College, the balance, some £15, being passed to the Sir Charles Hastings Fund.

Diploma in Physical Medicine

Dr. C. B. Heald attended on behalf of the Physical Medicine Group of the Association to present a resolution passed by the Group Committee calling for the provision of postgraduate education in physical medicine, and pointing out the desirability of taking steps forthwith to establish a diploma in the subject. The D.M.R.E. will be discontinued as from next October, and the existing diplomas in radiology do not include anything in the nature of electrotherapeutics. Dr. Heald said that his Group Committee was anxious to eliminate any pseudo-scientific approach to this subject which might remain and to place it upon a genuine scientific basis. The Executive Committee endorsed the opinion of the Group on the desirability of the scientific basis, and it was decided to reconstitute an earlier committee which had sat on this subject, so that the matter of the diploma might be brought to such a stage that active steps could be taken immediately after the end of the war.

Other business, of a routine or private nature, was transacted.

MEDICAL WAR RELIEF FUND

THIRTY-FIFTH LIST

Amount previously acknowledged, £44,377 12s 1d., and £100 3½% Conversion Stock, and £40 3% Defence Bonds

Individual Subscriptions

£10 10s.—Surg. Lieut. S M Musgrave, R N V R.

£5.—Dr H M Boston, Salisbury

£2 2s.—Capt R. L Lamming, R A.M C

£1 2s—Dr J. H Wright, Glasgow

£1 1s.—Major W. Happer, I M S, and Mrs Happer (10th donation)

£250.—Mufulira War Funds Committee, Northern Rhodesia

£138 0s. 9d.—Harrow Division Unaccompanied Evacuated Children Fund—per Dr Jewell.

£50.—Bournemouth Medical Society

£41 4s.—Newcastle-upon-Tyne Division—per Mr. Weldon Watts (amount already sent, £428 16s. 6d). Dr M. L. Anderson (2nd donation), Mr J S. Arkle (2nd donation); Dr R B W. Cole (2nd donation), Dr. T. Craig (2nd donation), Dr G Davison (2nd donation), Dr E. F Dawson-Walker (2nd donation); Dr J. Familton (2nd donation); Mr W A Hewitson (2nd donation). Dr. G. Hickling (2nd donation); Dr D. Hopkinson (2nd donation); Dr. J Hudson (2nd donation), Dr E L. Hughes (2nd donation); Dr. G Hurrell (2nd donation); Dr A E W. McLachlan, Mr A MacRae (2nd donation); Dr. J A Sacco, Mr J Kenneth Stanger (2nd donation).

£10 10s.—Plymouth Division—per Dr Mabel Ramsay (amount already sent, £312 17s 6d.) Mr. H F. Vellacott (4th donation).

£10.—Medical Staff, Newquay and District Hospital—per Dr. Hardwick.

£6 6s.—Lincoln Division—per Mr G A B. Walters (amount already sent, £206 15s 6d) · Mr J Lyons £4 4s.; Mr. A H Briggs £2 2s

£5 5s.—Association of Clinical Pathologists—per Dr E. N Davey.

£1 1s.—West Sussex Division—per Dr C W Elson (amount already sent, £55): Dr A R Adderley

S. Staffs L M W C—per Dr H. Campbell Orr (amount already sent, £73 5s). Dr E H Coleman (2nd donation)

10s. 6d.—Torquay Division—per Dr Lattey (amount already sent, £180 11s 6d) · Dr G H. Menzies (2nd donation)

Local Medical and Panel Committees

£44 9s. 1d.—County of Ayr (6th donation)

£32 7s. 10d.—Midlothian County (8th donation)

£41 2s. 6d.—Newcastle-upon-Tyne (4th donation).

£17 15s. 9d.—Dunbarton County (6th donation)

Total—£45.045 0s. 6d., and £100 3½% Conversion Stock, and £40 3% Defence Bonds

Cheques, payable to the Medical War Relief Fund, should be sent to Dr. G C Anderson, Honorary Treasurer of the Fund, British Medical Association House, Tavistock Square, London, W.C.1.

The Minister of Health, having considered the report of an inquiry committee and the recommendation of the Advisory Committee to which that report was referred, has decided to remove Dr Stanley Gasson's name from the medical list of the Portsmouth Insurance Committee as from July 20, 1942.

Correspondence

War Damage Insurance

SIR,—Dr. Aldred-Brown's courage in setting out his difficulties over war damage insurance is much to be admired, and may be of great service to his fellow practitioners. But he is a little less than just if he thinks that he was insufficiently informed and warned in the *Supplement* on the matter. Not only was there the note of Jan. 17, 1942, to which he refers as "insufficiently lucid"—though if he reads it carefully he may be inclined to withdraw that criticism—but long before that there were completely full expositions by myself on behalf of the Medical Insurance Agency on Jan. 25, 1941, and by Prof. R. J. A. Berry on Feb. 1, 1941. Dr. Aldred-Brown's plight, and that of his friends in Bath, is mainly due to his failure to heed the constant advice tendered to him and to the profession to do all their insurance of every kind solely through the M.I.A., the *raison d'être* of which is to protect their interests.

Only recently I was explaining this principle to an intelligent young physician, qualified 8 or 9 years; he said, when I had finished, "Why have I never been told all this before?" I had to point out that he had received a circular after his registration, another with every annual subscription notice from the B.M.A., a monthly whole-page advertisement (until the recent paper shortage) in the *B.M.J.*, and other forms of publicity as well; he simply had taken no notice, in which he followed the example of about two-thirds of the profession.

Incidentally, Dr. Aldred-Brown is not quite accurate in his illustration of the application of "average" in case "Y." The official ruling on this point reads as follows: "If the total value of the interest of the insured in the property insured at the time any loss is incurred shall exceed the sum hereby insured, the insured shall be considered to be his own insurer for the excess and shall bear a rateable share of the loss accordingly."—I am, etc.,

HENRY ROBINSON, M.D.,
Hon. Secretary, M.I.A.

SIR,—I regret to see from Dr. Aldred-Brown's letter in the *Supplement* of July 18 that he and some of his colleagues in Bath "have committed the error of either inaccurately or inadequately insuring our effects against war damage." Warning that, given war damage, such financial loss might be suffered in the way indicated by Dr. Aldred-Brown was published in the *Supplements* of Jan. 25 and Feb. 1, 1941, by Dr. Henry Robinson and myself, and the steps to be taken were indicated in my letter. I need hardly say that I do not write now in any spirit of "I told you so," but rather to support Dr. Aldred-Brown in his plea to all medical men to take, if they have not already done so, the appropriate steps now.—I am, etc.,

Bristol, 9. RICHARD J. A. BERRY.

The Home Secretary announces that Dr. Gerald Patrick McCarthy of Belfast is no longer authorized to be in possession of or to supply any dangerous drugs.

H.M. Forces Appointments

ROYAL NAVAL VOLUNTEER RESERVE

Acting Surg. Lieut.-Cmdr. J. A. Shepherd to be Surg. Lieut.-Cmdr.

Surg. Lieut. G. A. Hart to be Surg. Lieut.-Cmdr.

Prob. Temp. Surg. Lieuts. J. H. Hazeldene, R. St J. R. Johnston, G. J. W. Ollerenshaw, and C. A. Cheatle to be Temp. Surg. Lieuts.

ARMY

Col. S. J. Barry, late R.A.M.C., has retired on retired pay.

ROYAL ARMY MEDICAL CORPS

Lieut.-Col. (temp. Col.) W. Foot, M.C., to be Col.

Major (acting Col.) G. D. Gripper to be Lieut.-Col.

Lieut.-Col. W. Bruce, O.B.E., having attained the age for retirement, is retained on the Active List, supernumerary to the establishment.

Major (temp. Lieut.-Col.) C. L. Emmerson to be Lieut.-Col.

Major (temp. Lieut.-Col.) F. A. R. Hacker to be Lieut.-Col.

Lieut.-Col. G. W. G. Hughes, D.S.O., R.A.M.C., ret., has reverted to the rank of Major at his own request, whilst employed during the present emergency.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Majors W. W. Pratt and J. R. S. Mackay, having attained the age limit of liability to recall, have ceased to belong to the Reserve of Officers.

War Subs. Capt. M. Edwards has ceased to belong to the Reserve of Officers on account of ill-health and is granted the rank of Major.

TERRITORIAL ARMY, R.A.M.C.

Lieut.-Col. R. C. Clarke, O.B.E., T.D., having attained the age limit, has relinquished his commission and retains his rank.

Supern. for Service with Aberdeen Univ. Senior Training Corps (Med. Unit).—L. Schwartz to be Lieut.

Supern. for Service with Birmingham Univ. Senior Training Corps (Med. Unit).—J. A. Barclay to be Lieut.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

Capt. T. S. Eddy has relinquished his commission.

War Subs. Capts. J. Paxton and A. B. Hay have relinquished their commissions on account of ill-health and are granted the rank of Capt.

Lieuts. J. Gilmore and R. P. Young have relinquished their commissions on account of ill-health and retain their rank.

To be Lieuts.: L. I. Burrows, L. S. Davies, K. D. Keele, A. R. Adderley, H. G. E. Arthure, F. Barasi, C. Borg, W. I. Card, D. Y. Carter, M. C. Chapman, L. C. F. Chevens, H. P. Clark, A. B. Cooper, R. P. Coxon, J. D. Cronin, G. H. Ellis, J. A. P. Evans, A. D. Everett, R. J. Furlong, H. Gimpelson, B. W. Goldstone, C. J. Gordon, H. F. Griffiths, S. J. Hopkins, A. B. Kinnier-Wilson, S. E. Knowles, R. K. Levick, M. G. Langdon, R. A. Lattey, C. J. Longland, C. W. Marshall, W. R. Merrington, R. B. Morton, H. R. B. Norman, B. H. Page, J. W. Piper, N. L. Probert, H. S. K. Sainsbury, K. G. Seager, D. W. G. Smith, J. R. Squire, G. S. Steele-Perkins, D. L. McK. Stewart, E. M. Thorn, H. A. Thorner, J. Y. Walker, J. G. Warren, W. W. Wiggins-Davies.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

The following M.O.s have been granted commissions in the rank of Lieut.: Esme G. Shipp, Mary R. Paterson.

ROYAL AIR FORCE

Wing Cmdr. H. S. C. Starkey, O.B.E., retains the rank of Group Capt. on reverting to the retired list.

Mrs. M. I. Abelson, M.O. with the relative rank of Fl. Lieut., has resigned her commission.

Mrs. P. G. Stevenson, M.O. with the relative rank of Flying Officer, has resigned her commission.

To be M.O.s (Emergency) with the relative rank of Flying Officer for employment with the R.A.F.: Mrs. Caroline E. Nicholson, Miss Constance J. Pollard.

ROYAL AIR FORCE VOLUNTEER RESERVE

D. N. Parfitt to be Squad. Ldr. (Emergency).

Fl. Lieut. A. B. Sproule has resigned his commission and retains the rank of Squad. Ldr.

Fl. Lieut. H. J. Ross has relinquished his commission on account of ill-health and retains the rank of Squad. Ldr.

To be Fl. Lieuts. (Emergency): F. S. A. Doran, J. R. Byars.

Flying Officers F. J. S. Chapman, C. G. Fagg, T. A. H. Adkins, H. E. Walker, F. S. Shepherd, C. E. Thomas, J. Wilson, E. S. Frazer, M. T. Gallagher, R. G. P. Heard, T. Hepburn, K. Harrison, E. O. C. Parsons, P. B. Willan, T. F. Stewart to be War Subs. Fl. Lieuts.

To be Flying Officers (Emergency): C. L. Alderson, S. Y. MacKechnie, D. V. Martin, J. Perrin, R. A. Sandison, K. S. Southam, I. I. Thomas, J. I. Timothy, R. Varley, D. Jaboor, A. Jamieson, A. S. Johnston, G. F. Magurran, G. E. McFall, E. H. Moorhouse, P. S. Robinson, M. F. M. Ryan, J. W. Smith, R. W. Stevenson, M. Adams, C. H. D. Bartley, M. Donnelly, R. S. Henderson, P. R. Henson, R. C. Howard, W. E. Lishman, W. C. Moonie, G. B. S. Pimblett, F. S. Rickards, F. Stansfield.

R.A.F.V.R.: DENTAL BRANCH

G. M. Woolford, M.R.C.S., L.R.C.P., L.D.S., to be Flying Officer (Emergency).

INDIAN MEDICAL SERVICE

Lieut.-Col. K. S. Thakur has retired.

Majors M. Taylor, O.B.E., F. R. W. K. Allen, and W. Lawie to be Lieut.-Cols.

Capts. C. F. Gastit, F. W. Whiteman, W. Mackie, S. Ahmud, T. F. O'Donnell, H. B. Wright to be Majors.

EMERGENCY COMMISSIONS

To be Lieuts.: A. Gray, Isabel D. Patterson, D. A. K. Carnegie, Mary A. C. MacHugh.

ARMY IN INDIA RESERVE OF OFFICERS

Lieut. R. M. Hawes has ceased to belong to the Reserve on account of ill-health.

COLONIAL MEDICAL SERVICE

The following appointments are announced: J. Crabb, M.R.C.S., L.R.C.P., and K. E. A. U. Ground, M.R.C.S., L.R.C.P., Medical Officers, Nigeria, C. C. H. B. Sparrow, M.B., Ch.B., Medical Officer, British Honduras.

BRITISH MEDICAL ASSOCIATION

ELECTION OF 22 MEMBERS OF COUNCIL BY GROUPED BRANCHES IN THE BRITISH ISLES

As a result of the nominations received for Group H and Group O, the following have been elected Members of Council for the session 1942-3: H. R. Frederick (Port Talbot, Glam.); P. Martin Brodie (Edinburgh).

Branch and Division Meetings to be Held

KENSINGTON DIVISION.—At British Postgraduate Medical School, Ducane Road, W., Tues., August 4, 8.30 p.m. General meeting to conclude discussion on Interim Report of Medical Planning Commission.

POSTGRADUATE NEWS

A series of special postgraduate lectures, arranged under the auspices of the Honyman Gillespie Trust to take place in the West Medical Theatre of Edinburgh Royal Infirmary, began on July 23. Other lectures will be given on Thursdays, Aug. 27, and Sept. 10, 17, and 24, at 4.30 p.m. The lectures are open to all graduates and senior students. Details will be published in the postgraduate diary column of the *Supplement* week by week.

WEEKLY POSTGRADUATE DIARY

BRITISH POSTGRADUATE MEDICAL SCHOOL, Ducane Road, W.—*Daily*, 10 a.m. to 4 p.m., Medical Clinics, Surgical Clinics and Operations, Obstetrics and Gynaecological Clinics and Operations. *Daily*, 1.30 p.m., Post-mortems. *Tues.*, 10 a.m., Paediatric Clinic; 11 a.m., Gynaecological Clinic. *Wed.*, 11.30 a.m., Conference (Medical). *Thurs.*, 2 p.m., Dermatological Clinic. *Fri.*, 12.15 p.m., Conference (Surgical); 2 p.m., Conference (Gynaecological); 2 p.m., Sterility Clinic.

ROYAL NATIONAL THROAT, NOSE, AND EAR HOSPITAL.—*Fri.*, 4 p.m., Mr. J. C. Hogg: Nasal Obstruction.

APPOINTMENTS

HOPPER, MARY C., M.B., B.S., Deputy Medical Superintendent, South Middlesex Fever and Emergency Hospital.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.

MARRIAGE

NELIGAN—BELL.—On July 18, 1942, at Oxford, Gerald Anthony Neligan, M.B., B.Ch.(Oxon), to Marley Constance Bell.

DEATH

HAMILTON.—Florence May, dearly beloved and courageous wife of Lieut.-Col. W. R. D. Hamilton, R.A.M.C., died as a result of enemy action in Malta on July 13.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY AUGUST 8 1942

INSURANCE ACTS COMMITTEE OF THE B.M.A.

PROCEDURE ON MINISTRY'S REFUSAL

A meeting of the Insurance Acts Committee, which was fully attended, was held under the chairmanship of Dr. E. A. Gregg on July 16, when the principal matter considered was the reply of the Minister of Health that he was unable to accede to the Committee's request for a further increase in the capitation fee to compensate insurance practitioners for the increase which has taken place in the cost of living. This was but one of the grounds put forward by the Committee in support of the case. It was mentioned that the memorandum putting forward the case for an increase had, following upon its consideration by the Committee, been submitted through the solicitors to eminent counsel, whose suggestions had been embodied before it was submitted to the Ministry. In a lengthy and candid discussion the Committee considered what should be the next step to be taken. The general feeling, as expressed by the chairman at the close, was that a request should be made to the Ministry—and later to the Minister—to receive a deputation in order that the case might be elaborated orally, the argument reinforced, and an effort made to elicit and answer the considerations which had moved the Minister to a partial reply and refusal. It was felt that the Minister should be made aware of the unrest and sense of frustration in the profession at this official unwillingness suitably to recompense the insurance practitioner for the work that he is doing. If the reply of the Minister showed him to be adamant, it would be necessary for the Committee to go to their constituents to place the situation before them with a view to a decision as to the future course of action.

It was agreed that the Executive of the Insurance Acts Committee should act as the deputation, with the addition of Dr. H. G. Dain and Dr. John Hallam.

Organization of Insurance Practitioners

A booklet entitled "The Capitation Fee—A Comprehensive Survey of the Present Position with Some Suggestions for a Remedy," emanating from Group G (Staffordshire and Shropshire), to which Dr. Hallam, the representative of the Group on the Insurance Acts Committee, had written a foreword, was discussed. It followed upon a resolution of the Stoke-on-Trent Panel Committee calling upon the Insurance Acts Committee to formulate and put into action a definite and vigorous plan of campaign designed to place the insurance practitioner in a strong position with regard to further negotiations over the capitation fee and other matters. One noteworthy feature of it, specially significant in view of the present attitude of the Ministry, was the well-displayed contrast between the capitation fee of 7s. 3d. in 1912, when the income limit for insured persons was £130 and the cost of living was less than half of what it is at present, and the capitation fee of 9s. (plus a temporary 9d.) 30 years later, with the income limit raised to £420 and the work of the practitioner increased very considerably. The booklet accused the Ministry of breach of faith, and the Insurance Acts Committee itself of a certain lack of sympathy towards its constituents, and the procedure adopted at Panel Conferences was the subject of some adverse comments.

Although the booklet was criticized in certain respects, Dr. Hallam and his colleagues were warmly congratulated upon a spirited production. The chairman, in summing up the discussion, said he thought it was the general feeling of the Committee that the organization, partly through lack of effective propaganda, was not functioning to the full extent that they would all desire, and that the Committee was thereby hindered in what it sought to do for the profession. The actual machinery might be improved, added to, or altered in some way. He suggested that the matter be investigated by a subcommittee, which should include as large a number of members as possible who would bring a fresh mind to the task.

It was agreed, with three dissentients, to set up an *ad hoc* subcommittee, consisting of the chairman (*ex officio*) and Drs. H. G. Dain, J. Hallam, I. G. Innes, G. H. Pearce, A. T. Rogers, and F. M. Rose, to investigate and advise on the machinery for maintaining contact between the Insurance Acts Committee and the individual practitioner, and to have before it the booklet issued by the "G" Group.

Industrial Medical Officers

The Committee devoted a good deal of attention to the question of the relations between the industrial medical officer and the worker's own doctor. It was evident from the experiences related in the discussion that in some parts of the country at all events there is a feeling that it is necessary to make clear to industrial medical officers that only such treatment as is necessary during working hours should be undertaken at the factory. It was recognized that there are acute and urgent cases, covered by the ethical rules, for which the factory doctor can properly give treatment, referring them back to the patient's private doctor, but one member of the Committee from an industrial area mentioned cases in which factory medical officers are holding surgeries in factories, where the workers have to wait as long to see the doctor as in the ordinary surgery outside. More important, however, is the question of dual responsibility, the patient no longer relying on the doctor of his choice but on the doctor of his employer's choice. The Committee was urged not to alter the ethical rules, which sufficiently delimit the respective spheres of industrial medical officer and private practitioner.

This matter arose again on a communication from the Leeds Division, where letters have been received from industrial medical officers suggesting that during the ensuing winter months they should, acting on behalf of the patient's insurance doctor, be allowed to issue insurance prescriptions to workers unable, in the present industrial pressure, to attend at their doctors' surgeries The Committee, after a review of all the circumstances, was unable to approve of such a suggestion.

Other Business

Much other business occupied the 5 hours of the Committee's meeting One of several matters relating to certification was the question of the utilization of national health insurance certificates for members of civil defence services. Attention was called to a statement in the Home Security Circular 41/1942 on pay during sickness for persons in such services, in which reference is made to the admissibility of certificates given for national health insurance purposes for production during absence from duty on account of sickness. It was agreed to request the withdrawal of the reference to national health insurance certification.

Other matters touched upon concerned the *National Formulary*, the provision of specially expensive drugs, medical benefit for juveniles, a possible anomaly in the distribution of the Central Practitioners' Fund, and questions affecting the range of service. The minutes of a meeting of the Scottish Subcommittee were considered and approved, and, finally, sitting as the National Insurance Defence Trust, the members heard a satisfactory statement from the Treasurer.

Correspondence

Planning for General Practice

SIR,—We do not blame Dr. F. W. Grant (*Supplement*, July 25, p. 9) for disliking the type of State Medical Service which he envisages; it is a nightmare! To him we shall be disenfranchized. unable to express opinions at variance with our department, lose all initiative fear to take risks in the performance of our work, and have a definite limitation of opportunity. This, however, is far from being a true picture.

He commends those of us who devote time in striving for ideas engendered by the war, and then lumps ideologists and faddists together as wanting to make the profession accept criticisms and reforms it would view with suspicion in peacetime. War by its upheaval does tend to remind us, and rightly so, that the world is not static and that ideas are not immutable, and that progress is the summation of small evolutionary changes which manifest themselves, however, by sudden and very often marked mutations. The 24-hour working day for doctors is a normal accompaniment of their life. In war it is only accentuated. The majority under these circumstances never will have the opportunity to plan if we take his point of view.

Competition is an honest and healthy ambition provided it serves the community with an ever-progressive and advancing service. The reward of ability should be increased status and remuneration, and this, in our opinion, is a more desirable one than an ever-growing practice, which, by the very increase in the number of patients, must detract from the ability of the doctor to maintain high standards. In passing we might point out that the writer's remarks on the Soviet Union are ill founded, for the competitive spirit and reward for diligence and merit have always been a corner-stone of Soviet economy—e.g. the Stakhanovite movement.

The people ought to be able to, and should, take an intelligent interest in the medical services as against the writer's eulogy of the "faith attitude" which has been thrust on them and has its roots in mysticism—the cloak of medical ignorance.

The assumption that in a State Medical Service a clean sweep would have to be made of the present service is unwarranted and illogical. Have we not now many aspects of health administered to a greater or lesser extent by the State—e.g., N.H.I., public health, venereal disease, tuberculosis, and mental deficiency? A new State Medical Service will have, therefore, to utilize the best in the present and use this as a basis to build on. Dr. Grant, while admitting that a State Medical Service has much to commend it, proceeds to criticize it in that privacy and free choice will not be obtained for the patients, and there will be no reduction in night work, in the total hours of work, and in non-routine calls for doctors. As regards "free choice," the consensus of opinion seems to be that this will be very little different for the vast majority of the people from what it is at present. The assumption that in a State Medical Service privacy would be lost and the hours of work retained is not correct. In such a service patients could be seen by appointment, thus ensuring the first. As regards working hours, etc., it must follow that doctors co-operating in clinics as teams must be able to cope more effectively with the day's work, and so distribute doctors to an all-round 24-hours service on rota.

Those among medical men who favour a State Medical Service demand that it should be an improvement from the point of view of both the public and the doctor. It depends on the solidarity with which the medical profession negotiates a State service whether our remuneration will be commensurate with the importance of the work we are rendering the community. It is precisely because of this lack of cohesion among us that N.H.I. remuneration has stood at such a low level, and is, in fact, an important contributory cause of the demand for an improved service. Those to whom a State Medical Service does not appeal would be at liberty to set up in private practice and carry on as at present.

The fact that practically all writers on the subject stress the desire for co-operation between medical men, and between these and hospitals, institutions, specialists, and consultants, surely indicates a dissatisfaction with our present *modus operandi* and an implied, if not always openly expressed, desire for change. The fears that a State Medical Service would be run bureaucratically surely depend on whether medical men take the initiative in instituting progressive changes and participating through their organizations in their own administrative machinery. It is only through apathy on our part that a service can be brought in which will not have enough representative practitioners on its councils.

It is now axiomatic that for efficiency and the prevention of waste of effort modern methods must depend on co-operative and large-scale work. This has been acknowledged in modern industry by the ever-growing trusts and cartels in all countries, which, by virtue of a planned division of labour, obtain maximum production. This, whether we like it or not, is the inevitable outcome of modern methods, and medicine cannot be excluded from this trend. But here we have to remember that medicine is as much a public utility as sanitation and the water supply, and cannot be allowed to fall into the hands of a company or corporation. The Government, in taking over such a service, must not be allowed to set up a dictatorial Department, but must be guided in its administration by representatives of the profession. Force of public opinion and the unity with which medical men can approach progressive changes will be our greatest safeguards in protecting our interests. We are a necessary and key service in the nation's economy, workers in the nation's health. Let us see to it that we give them the best possible under optimum conditions.—We are, etc.,

P. INWALD.
London, N 19 W. W. FOX.

The G.M.C. and Medical Certification

SIR,—The remarks of the General Medical Council, in dealing with the case of Dr. Molloy (misleading certification), as reported in the *Supplement* of June 27, must have caused some uneasiness among hard-working practitioners. To imply, as the G.M.C. seems to do, that we must read and reread the innumerable forms of medical certificates we are called upon to sign so as to have their details always at our finger ends demonstrates a complete ignorance of present-day conditions. Many of the official certificates are so overloaded with small type that they call for honourable mention when placed alongside a page from *Bradshaw's Railway Guide*. No two are alike, and, clearly, if we are to be tied to the letter of these certificates, as the G.M.C. appears to think we should be, then the position calls for immediate review.

There are many occasions when it is most impracticable to issue certificates strictly in accordance with their wording. Thus in the case of the chronic invalid who at regular stated times to meet the requirements of the agent of his society sends for a monthly certificate, it is my practice to enter only one date against date of examination and date of signing, whether I have actually seen the patient on that date or not. The certificate as read is not strictly in order, but no injustice is done, and it meets the requirements of all parties concerned, though the practice would apparently give the G.M.C. a "tummy"-ache.

I suggest that where there is clearly no intention to mislead and no injustice is done such practices must by a gentleman's agreement be overlooked. Alternatively, the form of these certificates should be altered to meet the case. In particular, if we are to be held responsible for having read the text of all certificates, then a standard form should be adopted which should be in reasonably bold type and be limited to not more than 20 words.—I am, etc.,

Chesterfield. JAMES P. DAVIE, M.D.

LONDON DISTRICT MEDICAL OFFICERS

In the *Supplements* of April 11 and May 9 reference was made to a decision of the L.C.C. to reduce from September, 1941, the salaries of many of its district medical officers. It will be recalled that a Ministry of Health inquiry was held in March of this year following the county council's appeal against the Minister's refusal to consent to the proposed reduction of the salaries of a number of its permanent district medical officers. The Minister subsequently adhered to his decision not to consent to the proposed cuts. There remained a number of temporary or assistant district medical officers in whose cases the Minister's consent was not necessary to any proposal for a reduction in remuneration. The L.C.C. has now decided to withdraw the cuts imposed on these last-named officers. It is to be congratulated upon this recent decision. The net effect is that all the cuts imposed by the council in September, 1941, on the salaries of both permanent and temporary district medical officers are now restored. The London District Medical Officers Committee of the Metropolitan Counties Branch of the B.M.A. has acted on behalf of London district medical officers throughout.

POSTGRADUATE NEWS

The Fellowship of Medicine announces: M.R.C.P. course in neurology, West End Hospital for Nervous Diseases, Sept. 1 to 25, 3 p.m.; M.R.C.P. course in cardiology, Royal Chest Hospital, Weds., Sept. 2 to 23, 3.30 p.m.; Final F.R.C.S. clinical course, Weds., Sept. 9, 16, and 30, St. Mary Islington Hospital, and Tues., Sept. 22, Archway Hospital, 2 p.m.; Week-end course in advanced clinical surgery (including pathology), Hillingdon County Hospital, Uxbridge, Sat. and Sun., Aug. 29 and 30, 10 a.m. to 4.15 p.m.

B.M.A.: Branch and Division Meetings to be held

REIGATE DIVISION.—At East Surrey Hospital, Redhill, Sun., Aug. 9, 3 p.m. Agenda: To consider (*a*) Annual Report of Council and Supplementary Report; (*b*) Interim Report of Medical Planning Commission; (*c*) Preliminary and Final Reports of Division Study Group, etc.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.

BIRTHS

ELLIS JONES.—On July 27, 1942, at Ashwood Maternity Home, Woking, to Rosemary (*née* Case Morris), wife of Surg. Lieut. E. Ellis Jones, R.N.V.R., a daughter.

EVANS.—On June 20, 1942, at Liverpool Maternity Hospital, to Mary Evans, M.D. (*née* Kane), wife of Flying Officer T. J. Evans, F.R.C.S., R.A.F.V.R., a daughter.

MARRIAGE

RUSSELL—MORRIS.—At Leeds, on July 20, 1942, between Lieut. P. M. G. Russell, F.R.C.S., R.A.M.C., and Stephanie Denman Morris of Bryn Hyfryd, Abergele, N. Wales.

SUPPLEMENT TO THE

BRITISH MEDICAL JOURNAL

LONDON SATURDAY AUGUST 15 1942

THE B.M.A. AT WORK

Control of High-frequency Apparatus

With the valuable help of the Parliamentary Medical Committee, the B.M.A. has succeeded in securing an important modification of the Control of High Frequency Apparatus Order, 1940. Some months ago a deputation from the Association and the committee was received by the Postmaster-General, and represented to him the hardship suffered by many patients and many private medical practitioners owing to the restrictions imposed by the Order on electrotherapy. The Postmaster-General has discussed the matter with the other authorities concerned, and the following announcement has now been issued by the Home Office.

A relaxation has been made in the Control of High Frequency Apparatus Order, 1940, which prohibited the possession or use by any person in the United Kingdom of apparatus having a high-frequency output of over ten watts except under permit from the Postmaster-General. Under that Order it was not possible for permits to be issued except to certain classes of hospitals and similar institutions or to certain manufacturers and dealers and persons in charge of laboratories. This restriction has now been removed, and any person may apply to the Postmaster-General for a permit under the Order. A permit will not be issued until the applicant has installed a screen and mains filter in accordance with Post Office specifications. Any applications for a permit or for particulars of screening should be addressed to the Engineer-in-Chief, Radio Branch (W.2/8), General Post Office, Harrogate, Yorkshire.

The Secretary of State has also revoked the Aliens (High Frequency Apparatus Restriction) Order, 1940, which prohibited any enemy alien from having high-frequency apparatus without Home Office permission. It will still, of course, be necessary for any enemy alien who wishes to use or possess such apparatus to apply to the General Post Office for a permit.

PLACE OF PHARMACY IN MEDICAL PLANNING

DISPENSING BY DOCTORS THOUGHT UNDESIRABLE

The Pharmaceutical Society of Great Britain and the National Pharmaceutical Union have submitted a joint memorandum to the Committee on Social Insurance and Allied Services on the position of pharmacy in the future health services of the country. Various proposals are made with a view to the general reorganization of services which may be expected after the war, but it is pointed out that they are capable of immediate application even in present conditions.

First, with regard to hospital treatment, it is held that in any public service the supply of medicines in and from a hospital should be undertaken by a pharmaceutical department staffed by one or more pharmacists, or, in the case of small institutions, by a local pharmacist in private practice. The local pharmacist in private practice also might advantageously dispense prescriptions given to hospital out-patients. For those special services such as infant welfare, school medical care, and treatment of tuberculosis, which fall between the institutional and domiciliary field, a member of the pharmaceutical staff employed by the local authority should act as pharmaceutical supplies officer.

For domiciliary treatment, so far as the National Health Insurance scheme is concerned, provision is already made for medicines to be supplied by pharmacists, and it is urged in the memorandum that a similar arrangement should apply in all other domiciliary schemes of treatment, as, for example, public medical services. It is considered undesirable for a doctor to supply medicines. The reasons for this are, very shortly: (1) The training of the doctor in pharmacy is progressively smaller as the scope of the medical curriculum widens; (2) the practitioner supplying his own medicines is not likely to have available the wide range of medicaments which the pharmacist, serving the patients of many practitioners, must stock; (3) the practitioner can supply his medicines only when he is at his surgery (unless, of course, he is able to employ a dispenser), which limits the opportunity of his patients to obtain them; (4) there is no inspection of doctor's dispensaries, and tests of drugs or of the accuracy of the dispensing are not applicable. Nothing is said about rural conditions in which it may be easier for the patient to obtain his medicines from the practitioner than from a pharmacist.

The memorandum goes on to state that there are 15,000 pharmacists in Great Britain with facilities for supplying an excellent pharmaceutical service already utilized by the State for some 18 million insured persons. The uncontrolled extension of pharmacies offering a public service is not considered desirable, and it is held that new pharmacies should be opened only on proof of public need, and that no lower standard of staffing or service than that which obtains in National Health Insurance dispensing should be tolerated. Complaint is made of the system of remuneration under National Health Insurance, on the ground that the payment assumes that the pharmacist's business is already established on a profitable basis, and that the supply of medicines to insured persons is an addition or side-line.

Finally, the memorandum urges the importance of the advisory aspect of the pharmacist's work. Modern conditions are said to have enhanced the importance of the pharmacist as an adviser to the doctor. The latter frequently needs information about the properties of medicinal substances and guidance in the choice of such substances and the form in which they should be prescribed. Without such information and guidance it is suggested that prescribing is likely to take on a stereotyped character or to reflect an undue influence of propaganda designed to promote the use of proprietary products. Consultation between doctor and pharmacist should be encouraged. It is considered that failure to recognize the position of pharmacy and to utilize fully the knowledge and service of pharmacists means lack of efficiency and uneconomic use of medical supplies.

Correspondence

What the Patient Wants

SIR,—The interesting and thought-provoking letter from Surg. Lieut. Walton (*Supplement*, July 18, p. 7), giving the views of a serving officer on State medicine, stimulates me to tell a true story which illustrates the views of a serving private on the same subject.

During the last war I was on an official visit to the North of England, and I called to see a family of former patients of mine, convinced Socialists with whom I had often discussed the pros and cons of a State Medical Service. It so happened that the elder son, then in the Army, was home on leave, and I said to him, "Well, my lad, what do you think of a State Medical Service now that you have had some of it?" He was rather at a loss until I pointed out that in the Army he had all the advantages for which he had formerly contended—doctors paid a salary, free access of patients to every form of attendance required, no financial nexus or obstruction. "Well," said he, "my experience is that if you are *really* ill it is a grand service, with the best of treatment by first-class men in hospital. But if you are not feeling up to the mark—a 'belly-ache, for example—and you report sick you find that the doctor is not *your* doctor as he would be in civil life. He is a servant whose business it is to get you back to duty as soon as possible, and there is no sentiment about your relationship with him. That is all very well in wartime, but it would not suit me in peacetime, and I am certain my wife would hate it. We should want to have a doctor who realized that we had chosen him because we liked and trusted him and who would be a real family doctor."

There is a moral in this which I need not stress here except so far as to say, as a potential patient myself, "Them's my sentiments." When I am the patient I want my doctor to feel that I have sent for him *not* because he happens to be the officially appointed doctor for my area, but because I feel he is the man for me in my hour of need. And I have the temerity to believe that in so thinking I represent the man in the street—not, perhaps, when he is under the influence of politics, but when he or one of his family is ill—and that is what mainly matters to us as a profession. In our planning let us keep the man in the street in mind, and remember that he is not an automaton or a pawn in a political game but a human being with a mind and feelings (prejudices, if you like) of his own. If we as a profession, who ought to know men and women in their time of illness better than anybody, don't make our plans accordingly we shall be letting the public down, and the fact that incidentally we had obtained for ourselves a softer time and were now real civil servants would be regarded as aggravating an offence.—I am, etc.,

London, W.2. ALFRED COX.

Civilian Medical Services

SIR,—At a meeting of local practitioners called to consider the proposed limitation of areas of practice, it was resolved that in order to dispel from the public mind certain misconceptions which have arisen regarding this and other wartime medical economies, the following information should be furnished through the medium of the local press: (1) The restriction of civilian medical services is general and distributed evenly throughout the country, the calling-up of doctors being controlled by an impartial central medical committee. (2) It is not the intention of any competent authority, once the war is over, to bar the way to a restitution of the public title to free choice of doctor. Confident that similar steps with a view to reassuring the public are being taken in other parts of the country the meeting desired that Stockport's share in this common endeavour should be recorded in the *B.M.J.*—I am, etc.,

F. DALLIMORE,
Hon Secretary, Stockport Division, B.M.A.

The G.P. and the Future Medical Service

SIR,—G.P.s as a body will resent the imputation contained in the article in the *Supplement* for July 18, that the cause of much that is amiss in the practice of medicine to-day is the incompetence of the G.P. The further implication that what is needed is bigger and better examinations for students destined to be G.P.s should be resisted, for by now no one should be obsessed by the fallacy of thinking that examinations are a test of all that is desirable in the doctor, however much they may be a test of a certain form of specialized knowledge. We want more humanists in medicine, not professional knife and coin swallowers of much useless mental lumber that is forgotten as soon as learned, and for which some brains more than others have greater aptitude.

That the new G.P. arising from the ashes of the old is to be better fitted to make "an intelligent reference to the right department" is an ambition that is as futile as it is fatuous. If that is all that hospital staffs require of the G.P. why trouble to educate him medically any further than the stage of ward clerk, for any ward clerk knows that it is not customary to refer a hammer-toe, say, to the gynaecologist. It was said a few years ago that the G.P.'s surgery was rapidly becoming merely a kind of sorting office. Soon, perhaps, with the kind of super-G.P. envisaged in this article, instead of his surgery being only a sort of local P.O. it will perhaps become exalted to a species of G.P.O.

The picture, too, of G.P.s tripping up over each other in the wards of their local hospital has a charm all its own; but the average G.P. will be content to leave it at that. To him the day is generally too short and too strenuous; and when he often has, even in these days of increased wages, to make a living partly out of people who pay him 1½d. a week for attendance (including medicine) and not a sum reckoned in guineas for some brief and perfunctory examination, all he wants is to get on and be done with it, and perhaps have an hour to spare before bed-time for the benefit of his immortal soul.

Let the cobbler stick to his last; and leave the G.P. alone to his general practice.—I am, etc.,

Hove G. LLEWELLYN DAVIES.

BIRTHS

FERGUSON.—On June 29, 1942, at Altrincham, to Frances Thornton Ferguson, M B, Ch B. (*née* Wright), wife of Capt J H Ferguson, R A M C, a daughter (Frances Jane).

FYVIE.—On August 1, 1942, at Norwich, to Curtis (*née* Clark), wife of Capt H M Fyvie, R.A M.C., of Pietermaritzburg, South Africa, a daughter.

KELLY.—On July 28, 1942, to Ella Mary, wife of Dr. W P Kelly, Cowes, I.W., a son (Ian Lister)

KYNASTON —On August 3, 1942, to Joan, wife of Dr. Roger Kynaston, Kirkby-in-Furness, N. Lancs, a daughter (Georgina)

MACLEOD —At Lochmaddy, Isle of North Uist, on July 30, 1942, to Dr. and Mrs A. J. Macleod, a son.

DEATHS

ASHE —At the Dower House Ombersley, Worcs, on August 7, 1942, Henry Park Ashe, M.R C.S, L.R.C.P, after a short illness, aged 58

WILKS.—On August 4, 1942, Stephen Longmore Butterworth Wilks, M D (Lond), aged 75, at Colwyn Bay.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY AUGUST 22 1942

BRITISH MEDICAL ASSOCIATION

ANNUAL REPRESENTATIVE MEETING, 1942

The Annual Representative Meeting of the B.M.A. will be held at B.M.A. House, Tavistock Square, London, W.C.1, on Tuesday, Wednesday, and Thursday, Sept. 8, 9, and 10, 1942.

RESOLUTIONS BY DIVISIONS AND BRANCHES

Medical Planning Commission

Motion by Wandsworth:

That no decision for or against any form of change of medical practice should be expected until victory has been achieved.

Question 1

Motion by Guildford, Cardiff, Dorset, Dudley, Swansea, Isle of Ely, Lancaster, Isle of Wight, Trowbridge, Belfast, Lanark, Lincoln, Perth, Leigh, Lothians, Chesterfield, Greenwich, Harrogate, South-Eastern Counties, and West Norfolk:

That the following broad definition of the objects of medical service be accepted:

(*a*) to provide a system of medical service directed towards the achievement of positive health, the prevention of disease, and the relief of sickness;

(*b*) to render available to every individual all necessary medical services, both general and specialist, and both domiciliary and institutional.

Question 2

Motion by Guildford, Lancaster, Isle of Wight. Isle of Ely, Trowbridge, Belfast, Dorset, Lanarks, Lincoln, Leigh, Harrogate, South-Eastern Counties, and West Norfolk:

That free choice of doctor and patient be an essential feature of any future service.

Amendment by Barnet:

That free choice of doctor and patient should be an essential feature in any future service, provided certain regulations exist to prevent the will-o'-the-wisp tactics at present employed by certain patients.

Amendment by Cardiff, Perth, Lothians, Chesterfield, and Greenwich:

That in any reorganization of general practice as full a measure as possible of free choice of doctor and patient should be preserved.

Question 3

Motion by Guildford, Cardiff, Swansea, Lancaster, Barnet, Trowbridge, Belfast, Dorset, Lanarks, Perth, Leigh, Lothians, Chesterfield, and Greenwich:

That group practice should be a feature of any future medical service.

Amendment by Harrogate:

That the words "but not an essential feature" be inserted after "feature."

Amendment by South-Eastern Counties, Lincoln, Isle of Ely, and Isle of Wight:

That in any future medical service group practice should be encouraged in areas where it is suited to local conditions.

Amendment by West Norfolk:

That the following words be inserted at the end of the motion: "doctors retaining their private practice and domiciliary work."

Question 4

Motion by Guildford, Cardiff, Dudley, Swansea, Lanarks, Lincoln, Leigh, Lothians, and Chesterfield:

That provision, of whatever character, should be made by the Government for the whole community.

Amendment by Belfast, Dorset, Perth, and South-Eastern Counties:

That provision, of whatever character, should be made by the Government for a section of the community only.

Amendment by Isle of Ely and Lancaster:

That provision, of whatever character, should be made by the Government for that section of the community already covered by National Health Insurance and those persons of a similar economic status.

Amendment by Harrogate:

That provision, of whatever character, made by the Government, should be limited to the present insured population.

Amendment by Greenwich and Deptford:

That provision for complete services should be made by the Government for the whole community, if the costs are borne by the taxation of the whole community, but that if the costs are borne by a contributory scheme, then some upper limit of income should be made, provided there is some provision for those just above the income limit to contract in if desirous of so doing.

Amendment by West Norfolk:

That treatment other than hospital treatment should be provided by the Government to the dependants of insured persons and those of like economic status: hospital accommodation should be made available for the whole community.

Question 5 (a)

Motion by Trowbridge, Belfast, Greenwich and Deptford, Harrogate, Isle of Ely, Lincoln, South-Eastern Counties, and West Norfolk:

That the basis of the co-ordination and integration of health services should be extension of the type of medical benefit available under National Health Insurance to the dependants of wage-earners and others of like economic status, coupled with the enlargement of its scope by the inclusion of consultant and specialist services.

Amendment by Barnet:

That while the Representative Body is in agreement in principle with the extension of the type of medical benefit available under National Health Insurance to dependants of wage-earners and others of like economic status, coupled with the enlargement of its scope by the inclusion of consultant, specialist, and ancillary services, the contracting doctor should be guarded against exploitation by his patient by some statutory or financial protection.

Amendment by Lanarks:

That after "status," the words "and voluntary contributors" be inserted.

Amendment by Dudley:

That the following words be added to the motion: "and with considerable additional remuneration to practitioners."

Question 5 (b)

Motion by Swansea, Leigh, and Chesterfield:

That the basis for the co-ordination and integration of health services should be the establishment of a whole-time salaried government medical service.

Motion by Leeds:

That any future medical service for the community should be completely freed from all financial competition and personal financial motives, and that this could only be brought about by a graded salaried service which should apply to hospital staffs and those engaged in consulting and general practice.

Question 5 (c)

Motion by Guildford, Cardiff, Dorset, Lancaster, Isle of Wight, Perth, and Lothians:

That the basis for the co-ordination and integration of health services should be some method other than the extension of the type of medical benefit available under National Health Insurance or a whole-time service.

Question 6

Motion by Guildford, Isle of Wight, Lanarks, Perth, and Lothians:

That the plan set out in broad outline in the draft report of the Medical Planning Commission be adopted.

Amendment by Lancaster:

That the plan as outlined in the draft report be adopted, provided that the complete indemnification of every general practitioner for the loss of his practice be arranged.

Motion by Guildford, Cardiff, and Dorset:

That the central machinery in the future medical service should take the form of a corporate body.

Motion by Macclesfield and East Cheshire:

That this meeting favours the establishment of a corporate body with proportionate representation of general practitioners.

Motion by Guildford, Cardiff, and Lanarks:

That the local machinery in the future medical service should take the form of regional councils, representative of the local authority or authorities, the voluntary hospitals, and the medical profession.

Motion by Lothians:

That in addition to regional councils, there should be district and area committees.

Motion by Guildford:

That any scheme involving the abolition of capital value of practices shall provide for compensation in the form of cash or negotiable security, as alternative to compensation by pension.

Motion by Dorset:

That the Representative Body considers that agreement to any new scheme for the regulation of medical practice is subject to equitable remuneration being obtained, and also to an adequate and agreed compensation being given for the capital value of practices.

Motion by DUDLEY:

That, with reference to para. 69 of the report, it shall be an essential of any scheme in which the profession are required to participate that adequate capital sums shall be allotted to every entrant to compensate for loss of goodwill, and that this meeting considers that this matter has not received attention at the hands of the Commission, as is evidenced by the summary manner in which this is dealt with in "Entry to Service," *Journal*, June 20, p. 749.

Motion by CARDIFF:

That a special compensation scheme should be devised for men in the Services and for those who have suffered loss of capital under varied war conditions.

Motion by GUILDFORD:

That provision should be made for closer association of general practitioners with the work of hospitals, and that arrangements for accommodation be provided for general practitioners to attend in hospital those of their patients whose entry is dictated by the need for nursing, etc., and not by the need for specialist medical treatment.

Motion by CARDIFF:

That a proportion of consultants should be remunerated on a salaried basis.

Motion by LANARKS:

That the medical advisory machinery should contain adequate general practitioner representation.

Motion by ISLE OF WIGHT:

That in the regional councils a large proportion of the administrative posts should be held by medical practitioners of wide experience.

Motion by LOTHIANS:

That the central machinery of the medical service should be a government department.

Motion by LOTHIANS:

That remuneration of general practitioners should be increased in respect of length of service, special skill, and additional qualifications.

Question 7

Motion by GUILDFORD, CARDIFF, DUDLEY, SWANSEA, ISLE OF WIGHT, ISLE OF ELY, TROWBRIDGE, LANARKS, LINCOLN, PERTH, LEIGH, LOTHIANS, CHESTERFIELD, GREENWICH, and DEPTFORD:

That, in view of the fact that the full adoption of the plan may be delayed for various reasons, some interim changes should be made.

Motion by LANCASTER:

That no changes be made until a complete scheme can be introduced.

Motion by BELFAST:

That no change be made until the war is over and practitioners in the Services have returned.

Motion by WILLESDEN:

That the Representative Meeting is of opinion that there should be no radical changes in the present medical services so far as the work of doctors is concerned until after the war, and until those doctors who are on service with the Forces have returned and have had ample time to consider proposals made and to express their views thereon, and that the Representative Meeting pledges itself to oppose by every means in its power any changes except those of a temporary nature which may be necessary to win the war.

Motion by DORSET:

That the Representative Body considers that no major steps affecting the future conduct of medical practice should be taken until the return of the majority of practitioners from the Forces.

Motion by HARROGATE:

That no changes be made until 6 months after the termination of the war.

Motion by SOUTH-EASTERN COUNTIES:

That no changes be made until the war is over.

Question 7 (i)

Motion by GUILDFORD, CARDIFF, DUDLEY, ISLE OF WIGHT, ISLE OF ELY, TROWBRIDGE, LANARKS, LINCOLN, LOTHIANS, CHESTERFIELD, and GREENWICH:

That proposals for immediate post-war application should include the two-way extension of National Health Insurance to include: (*a*) the dependants of wage-earners and others of like economic status within the current National Health Insurance income limits, and (*b*) the provision of consultant and specialist services.

Amendment by DONCASTER:

That the following be added to the motion: (*c*) the transfer of the National Health Insurance functions of Approved Societies to the Government.

Amendment by SWANSEA:

That proposals for immediate post-war application should include the extension of National Health Insurance to the whole community without income limit.

Amendment by PERTH:

That the words "post-war" be omitted.

Question 7 (ii)

Motion by GUILDFORD, CARDIFF, LINCOLN, ISLE OF WIGHT, PERTH, LOTHIANS, and CHESTERFIELD:

That the proposals for immediate post-war application should include the establishment of experimental co-operative practice in some areas.

Question 7 (iii)

Motion by DUDLEY, LEIGH, LINCOLN, LOTHIANS, and CHESTERFIELD:

That the proposals for immediate post-war application should include the creation of Regional Hospital Councils with executive or advisory functions

Amendment by GUILDFORD, CARDIFF, ISLE OF WIGHT, and PERTH:

That the words "executive or" be omitted.

Amendment by LANARKS AND SWANSEA:

That the words "or advisory" be omitted.

Amendment by TROWBRIDGE:

That the words "with adequate medical representation" be inserted after "Councils," and that the remainder of the sentence be deleted.

Health Legislation

Motion by BOURNEMOUTH:

That, with reference to the Draft Interim Report of the Medical Planning Commission, this meeting is of the opinion that further consideration and criticism be given to the machinery for introducing health legislation.

Remuneration

Motion by WANDSWORTH:

That this meeting, being already dissatisfied with the present capitation fee of the National Health Insurance, is not willing to accept any smaller fee for dependants brought in by temporary or permanent extension of the scheme than that in force for already insured persons.

Consultation with Profession

Motion by TORQUAY:

That the final draft of the Interim Report of the Medical Planning Commission should be referred to the profession before it is submitted to the Government, and that an assurance should be obtained from the Government that no action will be taken until the men now serving in the Forces can be consulted.

Motion by CARDIFF, MACCLESFIELD, and EAST CHESHIRE:

That the findings of the Medical Planning Commission should not be considered as final until the medical men now on active service have had an opportunity of considering them.

Conditions of Service

Motion by CARDIFF:

That the conditions of service should be the same for men and women and that both should have equal opportunity of promotion and of gaining experience.

Motion by CARDIFF:

That any resolutions agreed to are subject to the conditions of service and system of management being satisfactory to the medical profession.

Motion by DONCASTER:

That any salaried medical service should provide adequately for illness among its members, for pensions, and for care of a doctor's dependants in the event of his decease.

Administration

Motion by DONCASTER:

That in the event of a full-time salaried medical service the local and regional administration of the scheme should be predominantly in the hands of medical men.

Membership of Local Authorities

Motion by GREENWICH and DEPTFORD:

That, with reference to paragraph 60 of the Draft Interim Report of the Medical Planning Commission, it is essential that the existing law be amended to permit medical practitioners to act as members of local authorities while participating in medical services before the full plan as outlined in the report of the Medical Planning Commission can be implemented.

Hospital Staff Committees

Motion by BIRMINGHAM CENTRAL:

That, with reference to para. 89 of the Interim Report, this meeting is in agreement in principle that committees of the senior medical staff should be set up in all hospitals. The medical superintendent, however, should be the chairman of this committee, and the resolutions of the committee shall be transmitted to the hospital management committee through him, otherwise it will be impossible for the medical superintendent to carry out his duties as chief administrative officer. It is also desirable that committees of other members of the hospital staff should be appointed and their resolutions conveyed to the committee of management in a similar way.

Publicity

Motion by BIRMINGHAM CENTRAL:

That, in view of the inadequate way in which publicity was given in the Press and radio to the Report of the Medical Planning Commission, it is the opinion of this meeting that some responsible member of the Medical Secretariat should be appointed to ensure that the views of the Association are put forward in a proper manner.

General Practice

Pay of Fire Service M.O.s

Motion by Cardiff:

That (with reference to the paragraphs of the Annual and Supplementary Reports of Council under the above heading, Doc. A.R.M. 2, p. 1, and Doc. A.R.M. 3) the fees for the Fire Service should be referred to the Council for reconsideration and report.

Motion by Stratford:

That the paragraphs of the Annual and Supplementary Reports relating to the pay of Fire Service M.O.s be referred back to the Council for reconsideration on the grounds:

(*a*) That the system whereby post office medical officers are given the extra duties specified to perform, solely in light of their Post Office appointment, is incorrect: it makes for an inequitable distribution of work and must tend to take away the prerogative of the Local Medical War Committees to arrange for and control the distribution of medical man-power;

(*b*) the capitation fee accepted in the case of certain members of the National Fire Service (12s. with dispensing) is absurdly low: while the numbers affected may be low, to accept such a capitation fee, at a time when an increase of the fee for National Health Insurance work is being applied for, may dangerously affect negotiations in the latter case.

Motion by Isle of Wight:

(1) That a capitation fee of 12s. for the medical treatment of ex-regular firemen to cover treatment and the supply of ordinary drugs and dressings is inadequate;

(2) that a capitation fee of not less than 9s. 9d. (exclusive of drugs and dressings) should be payable.

(3) that it should not be obligatory upon the medical officer to supply drugs and dressings where he does not ordinarily dispense, and the payment, if he does supply drugs and dressings, should not be less than that paid under the N.H.I.;

(4) that provision for mileage should be payable above 2 miles as in the case of N.H.I. patients.

Certificates

Motion by Coventry:

That (with reference to the paragraph of the Annual Report of Council under the above heading, Doc. A.R.M. 2, p. 1) the Association should take energetic steps to reduce the present time-wasting multiplicity of special certificates and forms which add so much to the burden of the general practitioner.

Dependants of Serving Men

Motion by Bristol:

That (with reference to the paragraph of the Annual Report of Council under the above heading, Doc. A.R.M. 2, p. 2) this meeting expresses its dissatisfaction with the reply received from the Government in respect of provision of adequate medical attention for the dependants of those serving in the Forces; and instructs the Council to press again on the Departments concerned the urgent needs of Service dependants.

Motion by City of Edinburgh:

That, being fully conscious of the difficulties of many dependants of men and women serving in H.M. Forces in meeting their ordinary household needs, the Association make the strongest recommendations to the Government to include the dependants of serving men and women in a scheme of insurance covering medical attention and treatment.

Motion by Lothians:

That the Council be requested to ask the Government to extend medical benefit to the dependants of men serving with H.M. Forces.

Motion by Leigh:

That the benefits of National Health Insurance be made available immediately to the dependants of men serving with H.M Forces on a non-contributory basis and without any means test.

Reservation of Maidservants and Dispensers

Motion by Birmingham:

That (with reference to the paragraph of the Annual Report of Council under the above heading, Doc. A.R.M. 2, p. 2) the Council be asked to persist in its efforts to safeguard doctors' interests by securing the reservation of (*a*) at least one maid in each doctor's house; (*b*) doctors' dispensers.

Finance

Expenses of Central Medical War Committee

Motion by Birmingham Central:

That this meeting regards the payment by the Government towards the expenses of the Central Medical War Committee as being very inadequate.

National Health Insurance

Constitution of Insurance Acts Committee

Motion by Council:

That the fifth column of the schedule to the By-laws relating to the Insurance Acts Committee (otherwise appointed) be amended:

(1) By the substitution of "36" for "30" in line 17;

(2) by the addition of the following words after line 28: "6 to be elected by the Annual Conference of Representatives of Local Medical and Panel Committees";

(3) by the substitution, in line 21, of "27" for "26";

(4) by the deletion of the following words: "1 to be nominated by the Association of Local Government Medical Officers of England and Wales."

(*Note*: The effect of these amendments on the fifth column of the Schedule to the By-laws is indicated by the underlining in the copy quoted below:

"Registered medical practitioners appointed as follows:

6 such practitioners (being members of the Association) elected (in the manner prescribed by the Representative Body) by the elected Representatives of the Constituencies formed for Great Britain and Northern Ireland under By-law 39, namely, 4 by all the elected Representatives (acting together) of the Constituencies so formed for England and Wales, 1 by all the elected Representatives (acting together) of the Constituencies so formed for Northern Ireland, and 1 by all the elected Representatives (acting together) of the Constituencies so formed for Scotland together with (36) practitioners (whether members of the Association or not) to be nominated or qualified as under, viz.:

(27) to be selected so far as possible on a territorial basis from among practitioners nominated by the Local Medical Committees and Panel Committees formed in Great Britain and the Local Insurance Practitioners' Committees of Northern Ireland under the National Health Insurance Acts;

(6 to be elected by the Annual Conference of Representatives of Local Medical and Panel Committees);

1 (being a member of the staff of a voluntary hospital) to be nominated by the Hospitals Committee of the Association;

1 to be nominated by the Medical Women's Federation;

1 to be nominated by the Society of Medical Officers of Health;

with power for the members of the Committee appointed as above provided to co-opt as additional members such number (if any) of non-panel practitioners as shall be required to secure that 4 such practitioners shall be members of the Committee, 1 of whom shall be in general practice in an industrial area."

Public Health

Compensation for Personal Injuries

Motion by Cardiff:

That (with reference to the paragraph of the Annual Report of Council under the above heading, Doc. A.R.M. 2, p. 3) if the Council is unable to obtain a satisfactory solution to the question of compensation for medical officers injured in air raids the alternative procedure of medical officers being enrolled as volunteers under the Local Authority for National Service, using Form E.D. 60, should be investigated.

Scotland

Chairman of Scottish Committee and Membership of Council

Motion by Lothians:

That the chairman of the Scottish Committee should be, *ex officio*, a member of the Council during his tenure of office.

Central Medical War Committee

Medical Services of Defence Forces

Motion by North-East Essex:

That this meeting notes with concern the present wastage of medical personnel and suggests that the Council should approach H.M. Government with a view to correlating the medical services of the Navy, Army, Air Force, and Civil Defence under one head.

Other Motions

Election of Council by Groups in Great Britain or Northern Ireland

Motion by Grimsby:

That By-law 55 (3) be amended to read as follows: The said voting papers shall be sent to the Association at the Head Office within such time as the Council may from time to time prescribe by notice given as aforesaid, and the particulars which shall be included in the voting papers shall be confined to the candidate's address. (*Supplement*, July 11, 1942.)

By-law 55 is as follows:

(1) The election of twenty-two members of Council by the Branches or Groups of Branches and Divisions in Great Britain or Northern Ireland shall be by means of voting papers sent by post by the Association from the Head Office to each member of every Branch comprised in the Group.

(2) The said voting papers shall contain the names of those candidates who have been nominated either (*a*) by a Division or (*b*) in writing signed by not less than three members of any such Branch and sent to the Association at the Head Office on or before an appointed day, of which not less than 14 days' notice has been given in the *Journal*.

(3) The said voting papers shall contain such other particulars (if any), and shall be sent to the Association at the Head Office within such time as the Council may from time to time, prescribe by notice given as aforesaid.

(4) The expenses of the said election shall be borne by the Association.

(5) Not later than the second week in the succeeding month of June a notice of the result of the election shall be published in the *Journal.*

Amendment by LINCOLN:

That the words "and age" be added after the word "address" in the foregoing motion by Grimsby.

Hospital Service Plan for London

Motion by BARNET:

That the Representative Body, while approving in general of the Hospital Service Plan for London, emphatically protests at the fees payable under the proposed scheme to the patient's own doctor and deplores the fact that the B.M.A. should have agreed to such totally inadequate professional fees.

Medical Profession in Parliament

Motion by NORTH-EAST ESSEX:

That the Council be asked to consider greater representation of the medical profession in Parliament

Legal Advice in Negotiations with Government Departments

Motion by SHEFFIELD:

That the Council be instructed to engage the whole-time services of a barrister of repute to make a close study of medical law and economics so as to be prepared to give advice and direction in the preparation and presentation of the Association's case in any future negotiations with government departments and if and when necessary to take part in such negotiations on behalf of the Association.

Fees for Part-time Work

Motion by WEST NORFOLK:

That a new scale of minimum fees be laid down for all part-time work for public authorities, government departments, and societies, and that they should be negotiated by the B.M.A. on a national basis.

Supply of Oxygen to Medical Profession

Motion by LIVERPOOL:

That the Representative Body condemns the practice whereby manufacturers of oxygen withhold the supply of commercial oxygen at retail commercial prices to the medical profession.

Medical Records of Services Personnel

Motion by GUILDFORD:

That the Council be asked to take steps to make available to civilian practitioners the medical history, including results of any special investigations, of men or women discharged from the Services for medical reasons.

The position of absentee or of "distant" practitioners—i.e., the patient lives beyond a defined distance from the doctor's surgery—under the terms of service for insurance practitioners is the subject of the latest amendment of the Medical Benefit Regulations. This provides that the absentee or "distant" practitioner is relieved for the time being of his obligation to attend an insured person otherwise than by deputy, and the latter, notwithstanding that he is acting as deputy, assumes the obligations of the absentee doctor just as if the patient were on his panel.

B1 HOSPITAL APPOINTMENTS

The Minister of Health announces (Circular 2679) that it has been found necessary to restrict the freedom of holders of B1 posts to transfer from one hospital to another. With the recruitment of B2 practitioners on completing 6 months in their posts, it will no longer be possible to appoint them to B1 posts, and difficulties will arise if holders of the latter are free to transfer to another hospital without regard to the needs of the one at which they are at present employed. The Central Medical War Committee has suggested that the powers of Defence Regulation 58A should be invoked to immobilize holders of B1 posts, a suggestion which the Minister of Health, after consultation with the Minister of Labour, has accepted.

The effect of this is that if a holder of a B1 post wants to leave his hospital (except on transfer to another under the same authority) and the hospital considers him essential, the Ministry of Health's Senior Regional Officer (or, in the case of a London hospital, the Ministry of Health) must be informed. The case will then be investigated in consultation with the Central Medical War Committee, and unless it is one in which the doctor might reasonably be allowed to move, the appropriate National Service Officer will direct him to remain in his post. It is hoped that holders of B1 posts will recognize the difficult position in which hospitals are placed, and by willing acceptance of the temporary restriction, which will operate in the first instance for 3 months from August 8, obviate the need for a formal direction by the National Service Officer.

BRANCHES AND DIVISIONS

The grouping together of Branches of the B.M.A for the purpose of electing 22 members of Council is a necessary procedure so far as the machinery of the Association is concerned, but it does mean that in some instances the elected member of Council represents a very wide area, and for that reason opportunities for him to get to know the views of his constituents do not occur as often as they might. Group K (or to those who are not familiar with the grouping—the Dorset and West Hants, the South-Western, and the Wiltshire Branches) has overcome this in a way which, it is hoped, will be followed by other Grouped Branches. Early this year Dr. J. A. Pridham of Weymouth suggested to the secretaries of the Divisions within the area that each should send a representative to a conference held for the purpose of meeting the Council member, Dr. F. A. Roper. The suggestion was evidently approved, for on July 1, 27 representatives (16 from Exeter and the remainder from Plymouth, Dorset, Bournemouth, Weymouth, Blandford, Dorchester, Torquay, Beaminster) met at the Royal Devon and Exeter Hospital, Exeter, under the chairmanship of Dr. J. A. Murray of Exmouth. Although the chief subject for discussion was the interim report of the Medical Planning Commission (the views of the conference will in due course be placed before the Commission), other health matters of general interest to the area were discussed. It is hoped to hold a similar conference in a year's time.

Correspondence

Remuneration under a State Medical Service

SIR,—The Wembley Study Group has been fortunate in stimulating deep interest among the local practitioners, and at a large and representative meeting held on June 23 it was decided to request you to bring the following matter to the attention of the profession:

"Having regard to the discontent in the past over the question of remuneration, the meeting strongly affirmed that no concrete scheme could be given approval until an opportunity had been afforded of giving adequate consideration to the question of remuneration. Too often in the past has the profession had agreed schemes and fees thrust upon it, and while this group is willing to give its whole-hearted co-operation to any system which will improve the medical service of the country, it cannot lose sight of the fact that adequate payment, pensions, and compensation must be a *sine qua non.*"

—We are, etc.,

J. SHIRLEY CALLCUTT (Chairman).
M. BARNET STUNGO (Hon. Secretary).

WEEKLY POSTGRADUATE DIARY

BRITISH POSTGRADUATE MEDICAL SCHOOL.—*Daily*, 10 a.m. to 4 p.m., Medical Clinics, Surgical Clinics and Operations, Obstetrics and Gynaecological Clinics and Operations. *Daily*, 1.30 p.m., Post-mortems. *Mon.*, Operative War Surgery Course commences *Tues.*, 10 a.m., Paediatric Clinic; 11 a.m., Gynaecological Clinic. *Thurs* 2 p.m., Dermatological Clinic. *Fri*, 12.15 p.m., Surgical Conference; 2 p.m., Gynaecological Conference; 2 p.m., Sterility Clinic.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.

DEATH

BODKIN.—At his home, Hangersley, Ringwood, Hants, on August 14, 1942, Herbert Alfred Bodkin, F.R.C.S.Ed., D.O Oxon., M.R.C.S.Eng., L.R.C.P Lond, aged 61.

The personnel of the special subcommittee of the I.A.C. announced in the *Supplement* of Aug. 8 (p. 14, column 2) included the name of Dr G H. Pearce This was a misprint for Dr. J. C. Pearce (of Diss, Norfolk).

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

LONDON SATURDAY AUGUST 29 1942

GENERAL PRACTICE: THE GATEWAY TO NATIONAL HEALTH

BY

A. WILFRID ADAMS, M.S., F.R.C.S.

In our post-war planning the weightiest consideration naturally is given to general practice, for besides having great numerical preponderance general practitioners are the spearhead of the attack against disease. The family doctor's services to the public may be usefully grouped under three headings: the teaching of abundant health, implied in which is preventive medicine; early diagnosis; effective treatment. The cult of health should be given first place, but owing to the prevalence of illness the doctor's time is fully engaged in "rescue work" to the exclusion of the far greater didactic role. Preaching prevention is no comfort to victims seeking relief from present suffering. Moreover, teaching is prosaic and apt to fall on deaf ears, whereas curing is a dramatic and impressive role for the doctor. In the vision of the future treatment comes last for it will be least needed. For the present, however, disease does make first claim on the doctor's time.

Certain improvements in general practice, though quite attainable, are yet lacking; they are (1) adequate time per patient; (2) decent quarters and equipment; and (3) formal association with a teaching centre—a regional Alma Mater. The natural solution is to be found in compound practices, although isolation seems the inevitable lot of doctors in remote rural regions. A doctor must unite in partnership with three or four colleagues. Sharing the same premises, they can afford a suite of rooms well warmed and lit, cleaning staff, and a nurse on the premises to dress wounds and deal with telephone calls. Such a favourable setting would give the doctor the requisite time for questioning, diagnosis, and treatment. In addition to his general interests, each of the partners would devote himself specially to some main branch—e.g., ductless glands, nervous system, etc. Because of the prodigious growth of medical knowledge it is only "firms" that can now cover the whole range of diseases. Each member of the firm could be familiar with the problems of the others, and they could be mutually available during absence on holiday or through illness. *Continuity of interest* results. This is a boon to the doctor and a tremendous asset to the patient. When, occasionally, a specialist's opinion was needed the general practitioner would attend the consultation. This would be stimulating to him and give the doctor a formal link with the hospital and a share in the treatment. All consultations, other than those required at the patient's home, would, in the traditional way, take place at the regular hospital clinic or private rooms. If he travelled round between widespread family practices, a consultant's time would be wastefully consumed.

The Family Doctor Relationship

The size of the partnerships is important. Small voluntary combinations (3 to 6 doctors) are already working well, and it is but evolution to standardize them for all towns. Yet although independent practice is unequal to the greatly increased demands imposed by modern medicine the general practitioner *must* maintain his traditional attributes as a family doctor. As he draws his patients from the neighbourhood in which he dwells he is endowed with a knowledge not only of their vocations but of their social setting. In his professional life he may be acquainted with two or three generations of a family. Such associations breed respect among younger and inspire confidence and trust in older folk. Patients often consult their doctor about matters which are not medical in the ordinary sense. It is this readiness to impart personal and confidential matters that the profession should do everything in its power to foster; for it is only in such an atmosphere that the patient overcomes a natural timidity to divulge early some suspected horror like a lump in the breast or other sinister symptoms. Treatment relatively so efficacious in the early stages of disease is apt to be little more than palliative when applied late. Therefore we must always strive for early diagnosis, and this can never become routine until patients consult their doctor when anything appears amiss as readily as they ring the fire station or police in an emergency.

The vital influence of the small size of partnerships has been fully considered, because a scheme of a more revolutionary kind was outlined in the *Supplement* of February 21 this year. In this doctors would congregate at "health centres" to the number of 10 to 20 with a correspondingly great total of patients. This may have alluring features, such as cheaper costs, but in my view would prove disastrous to the status of "family doctor." Doctors would lack the impetus and zest engendered by the "team spirit," for this does not flourish in larger groups, even though they adopt formal alliance. Only in a small group is it possible to be familiar with each other's patients and professional problems, and to deputize with tolerable satisfaction. In larger groups accessibility would be impaired because the patients would be derived from a greater radius. This hinders early resort to the doctor; it consumes extra time on visits, and accentuates those peculiar trials of medical practice—epidemics and night calls. Few experienced persons deny that distance tells against the patient.

Another, but, I believe, spurious, advantage offered by the scheme is the means of special investigation and treatment at the doctor's premises. Those who in towns seek to enrich their establishments by elaborate equipment, pathological and minor operating facilities, may glory in the sense of proprietorship in a "private hospital," but they mistake their mission. They seek to specialize while their patients pay for their services as general practitioners. They cannot do both jobs well. The general practitioner ranges widely over the body. He must mainly rely on his native wits, listening, observing, mapping out tenderness or swelling, testing reflexes, using the stethoscope, torch, tape-measure, throat swab, finger per rectum, sampling urine, and observing faeces. These incur time but no special gadgets. Such means of enlightenment are still neglected, and avoidable mistakes occur. Until simple aids are well used doctors can scarcely demand special and elaborate appliances.

I gravely suspect a move for developing medical practice on the lines of a shopping emporium, although this has proved so successful in commercial spheres. The doctor with his patients is akin to the priest shepherding his flock, not to a salesman and his customers. As a corollary, the size for family practice corresponds to the parish. The atmosphere of intimacy is apt to be absent from consulting rooms arranged like rows of offices. Patients know little of their doctor as a social figure, and he is comparatively ignorant of the background of their lives. Thus both miss essential factors in handling a problem containing psychological as well as physical components.

Preventive Medicine and Hygiene

The infant welfare, school, and other public medical services now largely provide for the population up to the age of 18 years. This lessens the influence and prestige of the doctor and deprives him of experience of the young and of adolescents. Inevitably this will lead to a deterioration in his skill and competence. and entail *loss of continuity* in the medical care of the patients. If the Government deems average doctors delinquent in regard to infant and child health, the remedy is not to ignore them and enrol a rival set of doctors in the public health service, but to ordain that due regard is paid during medical training to this vital subject—the medical needs of young life. Not only every workman but every family must have its doctor, and at the small medical centre accommodating a partnership of 3 to 6 doctors the care of the rising generation should be included.

We exult over our curative devices, but prevention of diseases would be a greater triumph First, the practical applications of the principle "prevention is better than cure" must be given due prominence in students' textbooks. Its implications must be faced in industry. The public needs to be taught the rudiments of health in diet, respiration, footwear, clothing, oral and bowel hygiene, recreation, etc.—all of which are at present grievously ignored, and not by the uneducated only. Disease will then become the exception and abundant health the rule. But who among us is to assume the role of teacher? It is an immense enterprise; for human weakness has to be overcome, and while suffering man will often co-operate gladly over an austere regime. yet "when the devil is well the devil a saint is he." In this vast educational problem the public is most likely to heed the words of one who has helped them in the past and responded to their summons at all hours of the day and night, Sundays and bank holidays included. It will need not the efforts of a few hundred health officials but the missionary powers of a 100,000 doctors. Without the great body of general practitioners the Government will but touch the fringe of it. More than this, before students are enrolled their "vocational" aptitude for doctoring should be proved at a preliminary test.

As his contribution to the public health service the family doctor will, besides coping with such procedures as inoculations, give talks at his professional premises on infant welfare, feet, diet, air, exercise, environment, and all that contributes to glowing health. There would be instruction on wider topics such as tuberculosis, cancer, drugs, patent foods, and specious claims of remedies that are fostered by present ignorance and credulity. He must be remunerated accordingly, and in this work might be under the jurisdiction of the M.O.H., though allowed as much freedom of expression in teaching as possible. With medical practice thus organized the family doctor resumes his status as sole confidant and guardian in health matters. This fact mobilizes fully the healing influences derived from whole-hearted faith and belief on the part of the patient and complete responsibility by the doctor. Thus would growing duplication and rivalry give place to unity and concord in one of the highest callings.

Total—£45,942 3s. 0d, and £100 3½% Conversion Stock and £40 3% Defence Bonds

Cheques, payable to the Medical War Relief Fund, should be sent to Dr. G. C Anderson, Honorary Treasurer of the Fund, British Medical Association House, Tavistock Square, London, W.C.1.

H.M. Forces Appointments

ROYAL NAVY

Surg Capt K H. Hole, O B E, has been placed on the Retired List.

Surg Lieut J. F Meynell to be Surg Lieut.-Cmdr

ROYAL NAVAL VOLUNTEER RESERVE

Surg Lieut R. E C. Copithorne to be Surg. Lieut-Cmdr

Acting Surg Lieut-Cmdr J. K Sargentson to be Surg Lieut-Cmdr

Prob. Temp Surg Lieuts G H Blennerhassett, J Dickie, D S C, and D. J Hoskinson to be Temp. Surg Lieuts

ARMY

Lieut-Col A N Fraser, D S O, retired pay, late R A M C, on ceasing to be employed, is restored to the rank of Col

ROYAL ARMY MEDICAL CORPS

Lieut.-Col (acting Col) H A Rowell, M C, having attained the age for retirement, has been retained on the Active List, supernumerary to the establishment.

Lieut.-Col A L Robb having attained the age for retirement, has been retained on the Active List supernumerary to the establishment

Capts. (War Subs Majors and Temp Lieut.-Cols.) A. D Bourne and G W Crimmin to be Majors

The following War Subs Capts (Temp. Majors) from temporary commissions to be War Subs Capts and Temp Majors, retaining their present seniority: R N. Hunter, S C H Lane, P. Reid

War Subs. Capt D. W. Woodruff has relinquished his commission and is granted the rank of Capt

Short Service Commission—Capt. C. W. A. Hughes has been placed on the half-pay list on account of ill-health

REGULAR ARMY RESERVE OF OFFICERS

Col. A N Fraser, D S.O, having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers

ROYAL ARMY MEDICAL CORPS

The following to be Brevet Majors under the provisions of Article 168, Royal Warrant for Pay and Promotion, 1940: Capt. (Temp. Lieut-Col. and War Subs. Major) J. S. Sloper, O.B E; Capts. (Temp Majors) R. J. Clausen, M.C., T. A J. M Dodd, and H J Davidson, M C.

TERRITORIAL ARMY, R A M.C.

Col J F O'Grady, T D, has relinquished his commission on account of ill-health and retains his rank.

Capt. J D W. McCracken has relinquished his commission on account of ill-health and is granted the rank of Major.

Capt. J H. Wilding has relinquished his commission on account of ill-health and retains his rank.

POSTGRADUATE NEWS

The Fellowship of Medicine announces: Final F R.C S Clinical Course, St. Mary Islington and Archway Hospitals, Wed., Sept. 9 to 30, 2 p m *Theory of Physiology;* eight lectures on Mon and Thurs, 8 p m., at Wimpole Street, W., from October 5 to 29—suitable for primary and final M R C P, F.R.C S and D A candidates Anaesthetic course, lectures at 3 p m. and 4 30 p m at Royal Cancer Hospital, clinical demonstrations at various London hospitals, daily from October 5 to 17.

The Faculty of Medicine of the University of Birmingham has arranged a course of post-graduate lectures on nutrition and nutritional diseases, to be delivered at the Medical School, Hospitals Centre, Birmingham, as follows: Tues and Wed, Sept 8 and 9, at 4 p m, Dr. H E. Magee (Ministry of Health), "Principles of Nutrition", Tues and Wed, Sept 15 and 16, at 4 p m, Prof V. P. Sydenstricker (professor of medicine in the University of Georgia, U S A), "Nutritional Deficiencies and their Clinical Manifestations"; Tues., Sept. 22, at 4 p m, Dr J H. Sheldon (lecturer in clinical medicine, University of Birmingham), "Special Aspect of Nutrition and Nutritional Deficiencies in Relation to Industry" All members of the medical profession are invited to attend the lectures.

WEEKLY POSTGRADUATE DIARY

BRITISH POSTGRADUATE MEDICAL SCHOOL, Ducane Road, W.—*Daily*, 10 a m to 4 p m, Medical Clinics, Surgical Clinics and Operations, Obstetrics and Gynaecological Clinics and Operations. *Daily*, 1 30 p m, Post-mortems *Tues.*, 10 a m, Paediatric Clinic, 11 a m., Gynaecological Clinic. *Wed*, 11 30 a m, Medical Conference *Thurs*, 2 p m, Dermatological Clinic *Fri*, 12 15 p m, Surgical Conference, 2 p m, Gynaecological Conference, 2 p m, Sterility Clinic

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W *Royal Chest Hospital:* Wed. 3 30 p m. M.R C.P. course in heart diseases *West End Hospital for Nervous Diseases:* Tues and Fri., 3 0 p.m. *Royal National Orthopaedic Hospital:* Sat. (Sept 5), 2 15 p m, Final F R.C S. course in orthopaedics.

ROYAL NATIONAL THROAT, NOSE AND EAR HOSPITAL —*Fri.*, 4 p m Mr. S E Birdsall: Sinusitis in Children.

BIRKENHEAD AND WIRRAL DIVISION—At Arrowe Park Hotel, Arrowe, Birkenhead, Sun, Aug 30, 5 15 p m Discussion of Interim Report of Medical Planning Commission and other important business All medical practitioners in the area are invited to attend the meeting

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s 6d This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.

MARRIAGE

BADENOCH—BRUNTON—On August 19, 1942, at St Martin's Church, Ancaster, Wing Commander Alec W. Badenoch, M A., M D, F R.C S, R.A F V R, son of the late J A. Badenoch and Mrs. Badenoch, Banff, to Jean McKinnell Brunton, M B, Ch.B, daughter of the late Alexander Brunton and Mrs Brunton of Leverhall, Musselburgh.

DEATH

CLARKE—On June 23, 1942, in a P O W Hospital, Italy, from heart failure, Lieut.-Col. A H Clarke, M.C, R A M C, dearly loved husband of Cicely (*née* Blunt), Maryville, Banchory, Scotland, and youngest son of the Rev H S. Clarke of Weybridge

SUPPLEMENT TO THE

BRITISH MEDICAL JOURNAL

LONDON SATURDAY SEPTEMBER 5 1942

Correspondence

Planning for General Practice

SIR,—My admiration for the masterly skill of Dr. F. W. Grant's article (*Supplement*, July 25, p. 9) is not diminished by my disagreement with some of his opinions. The parallel he draws between the careers of doctors in the Services and in a salaried State service does not appeal to me as a close one. Difficulty in filling vacancies may well be because the prospect of opportunity to practise the art for which the doctor has been trained is necessarily very poor in normal times among bodies of fit Service men. Do not some Service and also school medical officers transfer to private practice in the hope of better financial rewards?

A high standard of efficiency is attained by many general practitioners in examination, diagnosis, and treatment, but many doctors would probably admit that in dealing with such conditions as anaemia, asthma, arthritis, diabetes, fractures, skin affections, and the injection treatment of varicose veins and piles, their work falls short of what they would wish and what they might reasonably expect to attain in more favourable circumstances; these latter would welcome any system which promised improvement in this direction without serious countervailing factors. There are some men who do their best work as individualists, but it may also be held that there are many more whose best work would be done in a team, and that were team work introduced the general standard of treatment would be raised.

Two defects stand out in the present system: the field of general practice is too large, and co-operation and co-ordination are largely absent when the work is viewed as a whole. The subject of medicine is a very large one and in its entirety beyond the capacity of any one individual. Can a doctor who attends 10 confinements a year be considered to be the most suitable person to undertake such work? Is a man who sees one case of rodent ulcer in 3 years likely to spot the condition at once and start the appropriate treatment as quickly as the man whose work brings him into contact with many more such cases? So long as a system exists under which each doctor attempts to meet all the medical needs of his patients (with, it is true, the consultant and the hospital to fall back on) maximum efficiency of medical man-power will not be obtained. The number of clinics administered by local authorities increases because of the efficiency of the system, and the G.P. grumbles that inroads are made into his sphere of action. Other developments apart, a survey of the last few years would indicate a further increase in clinics with further inroads and some narrowing of the field of action of the G.P., but this should not in the long run give rise to anxiety, for its effect in the future would be to divert some possible entrants to private practice into the public health services.

A sickness service must be a 24-hour service. The G.P. is potentially on call all the time, with the result that irksome and irritating demands interrupt such leisure as might be his in a service in which times of duty are planned. Effective planning should be possible under a State system to meet the needs of a general practice service based on a "health centre" or "district clinic." The total amount of work would not be less, but organization would increase efficiency and save time. I believe that some of the opposition to a State service would disappear if it were possible to promise that there would be adequate medical representation on the bodies administering the scheme.

The amount of money paid to the panel doctor depends on the size of his panel, and so long as that method of pay remains in force and with it the competition among doctors for patients so long will it be impossible to provide a service of co-operation and co-ordination such as a salaried State service appears to offer. Were the N.H.I. system extended to include dependants, with the provision of health centres, there would still be this fundamental obstacle to the ideal national medical service.—I am, etc.,

Worthing. C. GIBSON.

"If"

SIR,—Surg. Lieut. Peter Walton (*Supplement*, July 18, p. 6) raises points of the utmost importance to the medical officer at present in the Forces and to the whole of the medical profession. Some of his fears are, I contend, based on misconceptions of what a medical service co-ordinated under the State need be if we are sufficiently aware of, and sufficiently determined to be satisfied only with, the best possible health service for the public and the best possible conditions for all who practise medicine and surgery. We cannot have one without the other. I agree that we are the trustees for those in the Forces, and that we should fight any attempt at radical alteration without their full discussion and approval, provided always that in the meantime no cataclysmic changes occur in the social structure of the country.

If a State Medical Service realized the gloomy forebodings of "loss of initiative, dependence on a superior or soulless bureaucracy for our choice of work, treatment, promotion, good behaviour reports, and holidays, etc.," then no sane doctor would for a moment entertain it. That changes are desirable and will come whether we like them or not is inescapable. To prepare for or against this contingency is not defeatism but is just common sense. The structure of any State Medical Service must be built on the foundation of the needs of the public. It must provide the best and most complete health machinery to promote their well-being, prevent where possible their illnesses, and treat their illnesses when they do occur. The type, the quality, and the use of that machinery are the province of the medical profession, for we know most about it.

If Surg. Lieut. Walton and all of us are trained with a preventive as well as curative outlook; if we attend our patients, limited in number, in consulting rooms at health centres that provide the necessary equipment, and the ready means of obtaining pathological investigation, specialist advice and treatment, and access to hospitals; if we decide the type of work we will do and have freedom in treatment; if our hours of work and days of holidays, our discipline, and our medical procedure are decided not by an ogre of a superior or superintendent but by ourselves in committee with our colleagues at the centre; if we live away from our surgeries in any part we like of a particular district; if we do not have to buy a practice; if we get reasonable compensation for the practices we have; if we get a good and reasonable salary with pension, taking into account our years of service and attainments, and recognizing the fact that we can never so organize medicine to eliminate completely the casualties, the emergencies, and the night work; if we can treat all or nearly all our hospital patients under the direction of a specialist, either at a local district hospital attached to, or a general practitioners' wing in, a larger general hospital, where we may attend our maternity cases, do minor operations, assist at major ones, give anaesthetics, become clinical assistants, attend refresher courses, take part in research, and specialize ourselves according to our bent; if we are members of the local hospital medical committee and have adequate representation on the management committee; if we have a central medical board, with advisory and statutory powers under the Minister of Health; if that board is truly representative of all medicine and its personnel partly appointed and partly elected so that while continuity is maintained there is periodic retirement of members (provided that the board have powers to co-opt a member of outstanding ability who would otherwise retire—the number of such geniuses to be limited); if that board and all committees are divorced from party and local politics; if machinery is set up for receiving suggestions for improvements from below as well as directing from above; if periodic review of the state of medicine is compulsory every ten years or so, so that committees do not become stale; if all these things can be accomplished—and they can if we demand them—would not Surg. Lieut. Walton and many others view the prospect of State medicine in a more favourable light?

We must not sit back and say that these things will never be allowed or we shall be given a service that satisfies neither the public nor ourselves. We must first consider what is best for our patients and ourselves; then we must enlighten the public as to our ideals for them and ourselves; and finally we must organize ourselves in order to achieve our aims.—I am, etc.,

G. W. M. MACKAY, M.B.,
Co-secretary,
Practitioners' Co-ordinating Committee
London, N 2.

Serving Officer Views State Medicine

SIR,—Like Surg. Lieut. P. Walton (*Supplement*, July. 18, p. 6), I have tried to keep pace with the spate of correspondence about the future of medicine. What he writes is, in my opinion, largely true. None of us will deny that changes are necessary in the medical world at home, but the idea of an all-embracing State Medical Service with all the accompaniments of a soul-destroying bureaucracy appals me. The many admitted advantages of State medicine would be completely outweighed by the lack of freedom. This freedom, which one willingly relinquishes in time of war, is what many of us hope to return to when we come back to civil life. The State has already shown its hand by taking many thousands of patients out of the private practitioner's care without consulting the profession.

The Medical Planning Commission, to which we should be grateful, has undertaken a great task. It is hoped that the opinions of the many Service medical officers will be taken into consideration and that no hurried decisions will be made.—I am, etc.,

V. H. BOOBBYER,
Surg Lieut.-Commander, R.N V R.

"Unpaid Medicine"

SIR,—I have been much interested in the correspondence covering State medicine. I think we are suffering in these parts from "unpaid" medicine. Recently I journeyed 15 miles on two occasions to give gas at the nearest dentist's for an insured person, and received the sum of 5s. for the two administrations, yet I believe for private patients the official fee must not be less than 10s. 6d

I should be glad if you would publish this experience, which is but one of many such instances in connexion with administration of gas to insured persons in these parts.—I am, etc.,

Kintbury, nr Newbury. N. J. BOULTON

STATE MEDICAL SCHEME FOR SOUTHERN RHODESIA

Two Southern Rhodesian Ministers have discussed a State medical scheme in recent speeches The Prime Minister (Sir Godfrey Huggins), himself a doctor, said the Government would appoint a commission of inquiry after the receipt of a report by a similar commission to be set up by the Government of the Union of South Africa. He saw no objection to a contributory scheme for Europeans, but tho scheme must not exclude Africans However, it was an urgent question and would be considered as soon as possible. The Minister of Internal Affairs emphasized the need for the scheme, and suggested that doctors should be salaried employees of the Government. The essential thing was to secure efficiency and a high standard of service. The Minister also stressed the importance of hospital service being available to all

At a meeting called by the Edinburgh Division of the B M.A. local doctors agreed to accept service under the domiciliary maternity service scheme arranged by the city corporation.

BRITISH MEDICAL ASSOCIATION

ANNUAL GENERAL MEETING

Notice is hereby given that the Annual General Meeting of the British Medical Association will be held in the Great Hall, British Medical Association House, Tavistock Square, London, W.C.1, on Wednesday, September 9, at 12.30 p.m. Business: (1) Minutes of the last meeting; (2) appointment of auditors; (3) report of election of President for 1942-3.

G. C. ANDERSON,
Secretary.

APPOINTMENTS

G F. WALKER, M D , M R C P. Medical superintendent and physician at the Peterborough and District Memorial Hospital

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s 6d This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue

BIRTHS

ALEXANDER.—On July 23, 1942, at Washington, D C , U S.A , to Brenda Alexander, M.B , Ch B. (*née* Miles), wife of Eric R. Alexander, British Air Commission, Washington, D.C., U.S A , a son, William Miles.

KERSHAW.—On August 28, 1942, at Adlington Hall, Cheshire, to Mary Cowell, M D., D M R., the wife of Surg. Lieut. W. E. Kershaw, R.N V.R , a son.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY SEPTEMBER 12 1942

THE B.M.A. AT WORK

MEDICAL CERTIFICATION

For many months the British Medical Association has been pressing the Government Departments concerned to ease the burden and to clarify the arrangements in regard to medical certificates. It is now able to announce important developments in connexion with two groups of certificates. The first consists of those certificates sought by workers as evidence that they are unfit to take a particular employment to which it is proposed to direct them, or as evidence in support of an application for permission to leave scheduled employment. The second group consists of those certificates sought in support of applications for exemption from fire-watching duties.

Agreement has now been reached with the Ministry of Labour and the Ministry of Home Security as to the procedure to be followed in relation to such medical certificates. The doctor to whom application is made should give one of two forms of certificates:

(*a*) A certificate describing the medical condition and including a recommendation on the industrial or fire prevention issue involved.

(*b*) A certificate describing the medical condition, making no recommendation on the industrial or fire prevention issue.

Alternatively, a doctor for one reason or another can decline to give a certificate, informing the person either that he cannot give a certificate or that an official doctor has been appointed for the purpose, and the person should apply to the Employment Exchange to be examined by the official doctor.

If, however, the doctor issues a certificate which sets out a specific illness or disability, clearly recommending the person unfit for the employment in question, the certificate will be accepted. Where the certificate is not of this kind, or the doctor has not given a certificate, the applicant will be referred for examination to a Medical Referee. Certificates for such vague conditions as muscle strain, headache, cough, dyspepsia, nerves, and debility will be referred to the Medical Referee, who will undertake a second examination.

Steps are being taken to appoint Medical Referees on the nomination of Local Medical War Committees. Local Medical War Committees have been asked, in deciding upon their nominations, to bear in mind the very important issues involved, and to select practitioners, whether men or women, with special knowledge of this kind of work. In a number of Local Medical War Committee areas more than one Medical Referee will be appointed.

The fee to be paid to the Medical Referee is 10s. 6d. per examination and report, or two guineas per session of two hours involving, as a general rule, the examination of six to eight persons.

These same Medical Referees will be asked to determine the fitness or otherwise of certain men who have already made applications against fire prevention duties and as a result there is likely to be a considerable amount of work at the outset. Fresh applications by men and women for exemption from fire prevention duties will fall to be dealt with in accordance with the general arrangements set out above.

It will be noted that these new arrangements will enable doctors, where they so desire, to inform applicants for certificates that there is an official machinery for the purpose. The result will, it is hoped, be that the profession will be relieved from pressure in cases in which the doctor does not desire to give such a certificate or where the doctor is not certain a certificate is justified.

In other directions the Association is also busy, and it is hoped soon to secure agreement to proposals to relieve the burden caused by some certification insisted on by employers, particularly certification for short periods of absence. In short, the Association is seeking to relieve the profession from all unnecessary medical certification, recognizing at the same time that there is much certification which must fall on the doctor because he is the only person who can make the necessary testimony. The profession desires to maintain a high standard of certification, and these new arrangements should help in this direction.

REPORTING OF DEATHS TO CORONER

Recently the medical superintendent of a hospital in one of the Home Counties was asked by the coroner to report to him certain deaths, among them: (*a*) deaths occurring either within 24 hours of an anaesthetic (general, spinal, local) or operation, or before consciousness is fully regained; and (*b*) deaths within 24 hours of admission to hospital. The General Practice Executive Committee of the B.M.A. at its last meeting considered this matter, and had before it Counsel's opinion on the validity of the coroner's request in these two instances. For the convenience of readers, Counsel has himself summarized as follows the opinion laid before the committee.

OPINION OF COUNSEL

From the earliest times the common law has obliged every citizen to assist the coroner by reporting to him any death into which he ought to inquire. The law is well stated by *Jervis on Coroners* as follows:

> "In all cases of sudden death or death under any circumstances of suspicion, where the duty of informing the coroner is not by statute imposed upon any particular person, it is the duty of those who are about the deceased to give immediate notice to the coroner or his officer, or to the nearest officer of police, who then communicates with the coroner."

There is plenty of judicial authority for this statement, and none to suggest that the medical practitioner is in a different position from any other citizen. A common-law right or duty is not modified or abrogated by a statutory provision except in explicit terms. Therefore, unless a statutory provision can be found which expressly, not implicitly, overrides this particular duty, the duty is still binding on a medical practitioner. In the circumstances with which I am now dealing a medical practitioner is not under any *statutory* duty to report a death to the coroner.

Statute Law

The statute law governing the circumstances is as follows. By the Births and Deaths Registration Act, 1926, sect. 1 (1), a body may not be disposed of without a certificate of the registrar or an order of the coroner.

Death certification is governed by the Registration of Births and Deaths Act, 1874. Sect. 20 provides for the issue of forms of death certificate, and lays down that in the case of the death of a person who had been attended during his last illness by a registered medical practitioner, that practitioner must sign a certificate of the cause of death and give it to some person who is required by the Act to inform the registrar of the death. This person is, briefly, a relative, or someone present at the death, or the occupier of the house. The Registrar-General has complete freedom to settle the form of the certificate. The Births and Deaths Registration Act, 1926, did not affect the form, and I believe it was not changed when the Act was passed.

The 1926 Act, however, by its sect. 6 (2), obliges the certifying medical practitioner to deliver the certificate to the registrar, and to give notice in the prescribed form of its signing to one of the persons who are required to inform the registrar of the death. Neither of the Acts refers to any duty of the practitioner to report any death to the coroner, and they have therefore not affected any pre-existing common-law duty he may have owed to report the death.

Duties of the Registrar

Under the 1926 Act a detailed code of statutory regulations was made for the guidance of registrars (Registration of Births, Deaths, Marriages, etc. (England) Consolidated Regulations, 1927; S.R.O. 1927, No. 485, Part IX) Para. 75 of these regulations directs the registrar to report various classes of deaths to the coroner. These include: "(iv) Any death occurring after operation necessitated by injury, or occurring under an operation or before recovery from the effects of the anaesthetic." When the registrar has reason to believe that the circumstances of a given death oblige some other person or authority to report it to the coroner, he must satisfy himself that the duty has been carried out.

These regulations were carefully framed to create a watertight system by which the registrar should inform the coroner of any death into which the coroner ought to inquire. They were drawn up to harmonize with the provisions of the Coroners (Amendment) Act, 1926, which sets out the powers and duties of the coroner. The Home Office authorities who drafted these regulations were evidently in no doubt that medical practitioners owed in some circumstances a legal duty to report a death to the coroner. The Home Office circular on the subject dated June 28, 1927, after emphasizing that a doctor must always give a death certificate if he knows the cause of death, and must not withhold the certificate merely because the death may call for an inquest, continues: "If the practitioner has any reason to believe that an inquest may be necessary, it is of course his common-law duty as one of those about the deceased to notify the coroner, or his officer, or the police; but this does not of itself relieve him of his other duty of certifying the cause of death."

The Coroners Acts, 1887–1926, lay down the circumstances in which a coroner is put on inquiry, but do not impose a duty on any person to report a death to the coroner.

The Practitioner's Duty

Until the passing of the Births and Deaths Registration Act, 1926, no medical man seems to have questioned his obligation to report to the coroner any death into which the coroner ought to inquire. Since the Act came into force, however, a body of opinion seems to have grown up that the doctor's duty to report suspicious deaths to the authorities was restricted by it to the completion and signing of the certificate and the delivery of it to the registrar.

Assuming that the duty to report to the coroner existed before the 1926 Act, I cannot see how it can have been in any way modified by the passing of the Act and the Consolidated Regulations. It is true that these lay down a system by which the registrar shall report suspicious deaths to the coroner, and shall satisfy himself that they have been reported by the person who ought to report them. But I do not see how the imposition of this duty on the registrar could in any way relieve the certifying practitioner of a duty he already owed. The new system may work perfectly, and in practice it may be superfluous for the practitioner ever to report a death to the coroner. This fact, if it is a fact, cannot, however, absolve him from a legal duty, if he owes one, to report certain classes of deaths himself. The registrar may conceivably fail to carry out his statutory duty, and a death about which the coroner ought to know may not come to the coroner's notice. If a medical practitioner knows of such a death and has not notified the coroner he is surely at fault. He cannot say that the 1926 Act implicitly permitted him to assume that the registrar would do his duty.

In my opinion, therefore, a medical practitioner who knows that a death has occurred in circumstances which would put a coroner on inquiry under the Coroners (Amendment) Act, 1926, owes a common-law duty to report the death to the coroner, quite apart from his duty of certifying the death to the registrar under the Registration Acts. What, if any, penalty a doctor would incur for the breach of this duty is not clear. If a doctor were ever charged in court with its breach, the court would first have to hear prolonged legal argument on the question of whether the duty existed.

H.M. Coroner's Requirements

Assuming that the doctor owes the common-law duty of the ordinary citizen to report certain classes of deaths to the coroner or police, it is necessary to inquire how far this duty corresponds with the requirements of the coroner in question.

A citizen must report every death about which, to the best of his knowledge and belief, the coroner ought to be informed. The practitioner is in a better position than most other citizens to know what deaths the coroner ought to take notice of, and he owes a duty to employ his special knowledge. A court might reasonably expect a practitioner to know what constitutes a violent or unnatural death, or a sudden death of which the cause is unknown—the kind of death, in fact, into which the coroner is obliged by statute to inquire. Hence a coroner may fairly send a practitioner a standing request to inform him of all deaths that come under these headings; nor is it in my opinion unreasonable for such a request to cover the classes of deaths which, by the Consolidated Regulations, the registrar must report to the coroner.

The first of the coroner's requirements about which I am asked to advise seems on this footing to be reasonable. When a patient dies within such a time after the administration of an anaesthetic or the performance of an operation that one of these may have caused or contributed to the death, then it is a death into which the coroner is bound to inquire, for it is obviously not a natural death. I therefore think the practitioner in attendance owes a duty to report it. Twenty-four hours is, as the coroner says, purely a convenient and minimum period.

On the other hand, a medical practitioner is *prima facie* enabled by his professional training to decide whether a given death, not occurring in circumstances which of themselves put the coroner on inquiry, is a natural death. In my opinion the common law permits and requires a practitioner to answer the question whether, in the case of a death which may be natural, there is room for reasonable doubt concerning its cause, or for reasonable suspicion that it is not a natural death. I do not think a coroner is entitled to indicate a class of deaths which may include both natural and unnatural deaths, and in which circumstances do not necessarily raise a doubt or suspicion, and require the practitioner to notify all such to him. In doing so he is claiming a right to settle a question which is within the province of the practitioner.

I therefore do not think that the second class of deaths about which I am asked to advise is one which the coroner may lawfully require a practitioner to report to him.

The Home Secretary announces that he has restored to Dr. Herbert Cecil Duckworth the authority granted by the Dangerous Drug Regulations to be in possession of and to supply drugs to which those Regulations apply.

Correspondence

G.P. and Hospital Practice in Canada

SIR,—Perhaps the enlargement of a few remarks I made at recent B.M.A. meetings called for the purpose of discussing the interim report of the Medical Planning Commission might be of interest. These meetings have been so well attended, and competition to speak has been so fierce, that a very obvious inference can be drawn by all.

During 2½ years in house jobs in Canadian hospitals (east and west) I noticed the following:

1. There are no nursing homes in Canada. Let the hearts of some of our public health authorities beat faster with joy on reading this

2. There are a tremendous number of hospitals of all sizes dotted all over the place. All these hospitals have laboratories, x-ray apparatus, and other modern diagnostic means.

3. All doctors have access to hospitals. They admit and treat their own cases, order and read the results of laboratory and x-ray investigations, and act upon them. Those who wish to operate do so. They can thus carry on with their cases a stage further than in general practice here. These remarks apply to both public and private wards.

4. All hospitals take midwifery cases either in a ward or in a separate block. In towns and cities a confinement case in a private house is rare. All doctors do their "midder" in hospitals; "midder" goes on day and night, as the house-surgeons know who have to give all anaesthetics and do many public ward cases.

5. The steptococcus is not the inevitable companion of the G.P. on these occasions.

6. The G.P. waiting an hour or more—perhaps at night—for a confinement to finish has a comfortable sitting-room at his disposal, with telephone and daily paper. The settee has an equipment of sheets, blankets, etc., if a doze is required. There is also a kitchenette with refrigerator, and he can make tea or coffee, etc, himself or have it made for him, depending on staff arrangements. His car is meanwhile plugged into an electric point outside the hospital and the radiator does not freeze When it is 20° below zero these are all useful arrangements.

7. Exceptions to all foregoing remarks are the large teaching (University) hospitals, of which there are only 3 or 4 in Canada—e.g, the Toronto General—which like ours here do not admit the G.P. to their public wards. But they all have luxurious private blocks.

8. There is no panel system, and what the G P. charges his poor patients in public wards is nobody's business.

9. Specialists can be called in at any stage of the case, and it is usual to call in a specialist on the staff of that particular hospital. No particular fuss is made if an outside man is called in. Specialists also have their own cases in hospital; the G.P. does *not* cram the wards with his patients, as the reader might think by now.

10. There is no confusion over several doctors coming into one ward. All orders, from one tab. ac. acetylsal. to an intravenous injection of a sulphonamide, are written and signed for in sister's order book open on the desk for all to see; by *all* I mean nurses and house staff and visiting doctors.

11. Simple pathology—such as cell counts, microscopical examination of urine, and staining for the more obvious bacteria—is

done by house-surgeons. More complicated work is done by a pathologist and radiologist who visit every day, or twice a week according to the size of the hospital.

12. The above remarks apply equally to doctors single-handed in practice or working as members of a group in the local Medical Arts Building. As Dr. Harry Boyde points out, these often call themselves "clinics"; even so they have to send some patients to hospital.

I am, etc.,
Ilford. FRANCES E. SMITH.

Aid for the Overworked G.P.

SIR,—For a considerable time I have been watching for news that the B.M.A. had achieved some simplification and reduction of the certificates required of those of us who remain to carry on the practice of medicine. So far I have looked in vain. On the other hand the approved societies are to press for more care in the issue of certificates (*vide* the report of their National Association). Are we to receive a circular stressing the need for more care, with the penalties involved, or are the approved societies to be told very firmly that while all care is exercised they must be less exacting in their demands and that certain modifications must be introduced? Suggested modifications are: (1) the replacement of monthly certificates by six-monthly ones where feasible; (2) the reduction of weekly certificates to one at the beginning and end of the incapacity; (3) the reintroduction in some form of the Regional Medical Officer purely for reference by doctors of those patients whom they suspect of "putting it on" but to whom for various reasons they have to give the benefit of the doubt.

It would further assist the decreasing remnant of civilian practitioners if the B.M.A. secured: (1) the authorization of prescriptions for quantities of drugs that are to be taken regularly or of prescriptions "to be repeated three times"; (2) the official recognition that it is adequate only to indicate on N.H.I. records the major maladies and the duration; (3) the issue of standard private certificates so that employers would be left in no doubt at all, especially in the case of patients who are off a day or two before they attend the doctor; (4) the removal of doctors from the lists of authorized persons for the duration of the war where justices of the peace and ministers of religion can just as well do the certifying. Many of these amendments would go far in peace to save the doctor's time and energy for clinical work. In war they are plain common sense, beyond any quibble. Emergency conditions need emergency sanctions and immediately, for the war is now three years old.

Propaganda planned psychologically and carried out repeatedly could save much time and irritation. A notice such as the following in the leading papers once a month and displayed adequately in all waiting-rooms would gradually impress a public that does not want to cause extra trouble but so often does:

"Now that so many doctors are in the Forces and the work of those remaining is so heavy:

"1. Do not send for or telephone your doctor if you can go to him.

"2. Do not send for him after he has gone out; this may need a special journey and waste time and petrol.

"3. If you are insured, make sure you have your medical card and thoroughly understand it.

"4. If you are an anxious relative wait till the doctor calls to talk to him.

"5. When you do go to your doctor make sure you are not going out of hours.

"6. Don't ask for certificates to cover absence from work for the period before your attendance at the surgery.

"7. Kindly pay your account on the first application; this will save time, paper, and postage.

"8. If your usual doctor is in the Forces please state this openly at your first attendance; your own doctor will not then suffer because he is away."

Someone may be able to improve on this, but something of its kind where it cannot be missed, and repeated often, would achieve much.—I am, etc.,
Timperley. JAMES A. KINNEAR BROWN.

Future of Medical Practice

SIR,—Articles and letters in the *Journal* on the future of medicine assume that doctors will be free to practise in the future as they have been doing in the past. That assumption is dangerous and untrue, for the Government by the hands of its local authority agents will soon have control of all practice. Read Prof. Picken's recent articles in the *Supplement*; study the steady encroachment on our work even in the past 10 years; listen to the declared aims of those authorities regarding their intended control of all hospitals and the remains of private practice, and realize how very soon we shall be disinherited without consultation, compensation, or thanks. Personally, I think we have talked too long, and it is now too late to avert our fate.

I would ask my fellow-members of the B.M.A. to consider these points: Do you think that an optional association like the B.M.A., armed only with powers of persuasion and commanding a membership which does not embrace all medical men, can battle successfully for us with our adversaries? Is it not true that any gain we might obtain would depend on the generosity of such opponent, and is it not true that on the whole we have little else to show for our negotiations in the past but the contempt of our opponent? Is it not true that the B.M.A. membership embraces both the local authority and private doctors: that the local authority doctors make the balls that the civilian doctors fire, and guide and direct the encroachments we suffer from? The B.M.A. smiles equally on the slayer and the slain. It provides a nominated sanhedrim whose members plan a nebulous future which for ever will be a mirage and a dream, whose only use is to bemuse us until the State axe falls on the now emaciated neck of private practice.

The remedy is a compulsory all-in union with disciplinary powers to include dentists, nurses, and doctors. This would make us masters in our own house, able to face the future, none making us afraid This alone can save us. It is needed badly. It is needed now.—I am, etc.,
Glasgow JAMES COOK.

Industrial Certificates

SIR,—I still notice from time to time in your columns grumblings by the laity on the subject of doctors' certificates issued for use in factories either claiming release from work or advising transfer I have recently kept very full records of these certificates and patients, and it appears quite certain that there is very little wrong with the certification.

One point, however, does emerge, from which it appears that the doctor is being put in a false position. There are a number of cases in which a worker has already applied for release or for transfer through the normal channels at work, and the reasons given for this application are purely domestic. For instance, if a woman has a home to run she may not be able to combine shift work with the efficient running of a house and the care of husband and children. When these negotiations fail the worker either is told to apply to her doctor for medical evidence in support of her plea or applies on her own account. In order to make out a better case for the issue of a certificate all sorts of symptoms are alleged and the previous history of a failure of negotiations is suppressed.

It is quite understandable that a doctor in his consulting room will recognize that there is some underlying cause for the application to him for a certificate, but will be at a loss in these cases to find suitable words in which to express a medical opinion. The resultant certificate, therefore, sinks to the level of an allegation of nervous debility or anaemia or some attempt is made to explain the domestic circumstances. It will be seen, of course, that when such a certificate is produced as a piece of evidence in the reopening of negotiations at the worker's place of employment, it will very easily lend itself to criticism on the grounds of having been issued without sufficient consideration.

I do not for the moment suggest a remedy, nor even that a remedy is necessary. Such cases seem to fall, to a large extent, within the province of the National Service Officer, but I think we should remember that the doctor is the last remaining bastion of freedom of speech and thought in these troublesome times of conscription, and that an appeal may be made to him, either by the employee or by the employer on the employee's behalf, with the unconscious intention of avoiding unnecessary complications.—I am, etc.,
"AN INDUSTRIAL MEDICAL OFFICER".

Lieuts. E J Murphy, A. S. Sheahan and A J. Matheson have relinquished their commissions on account of ill-health and retain their rank.

Dr (relative rank of Lieut.) K. Caseley has relinquished her Emergency Appointment as M O.

To be Lieuts : J M Clow, T B. Harvey, D. F. Ryan, E. H. C. Earl, A. S. Thorley, J. R B. Alexander, F. H. Batchellor, D. S. Boyle, P L. Brunnen, T S. Chalmers, P J Cremin, P. A. Duke, H. Goldstone, H F. Green, C H. Jones, R. McInroy, N. H. A MacKinnon, N. C. Norman, K. I. Peckitt, I. E. Phelps, R. P. A. Rigg, J. F. Smith, J. T Spare, A Stephen, F. J. E. Stuhl, H. R. Thomson, K. F C Brown, A. J Cokkinis, A. A. K. Datta, E. D. C. W. Davies, D. V. Maddison, J. MacFarlane, E. L McQuitty, R. Nutt, B. O. Porchetta, A. G Potts, J. S Pringle, L. Rendell-Baker, G K C. Rettie, R S. Ritson, A. I Ross, J H Tasker, D. MacG Williamson, A. L Wyman

WOMEN'S FORCES

EMPLOYED WITH THE R A M C.

Lieuts. A. M. Bean and M H. Edmond have relinquished their commissions and retain their rank

The following M O.s have been granted commissions in the rank of Lieut : Margaret M. Gourdie, Elizabeth Matheson, Janet S F. Niven, Rosa M. Piggot, Elizabeth L. Taylor-Jones, Enid J Fair, Elizabeth M Mitchell, Bertine M Will, Elizabeth M Rees, Esmé M Grant, Margaret M. Shepherd, Eva Dolan, Thelma M. Ward, Leah Rosenbloom, Emily S. O Lewis, Eveline M Cumming

ROYAL AIR FORCE

To be M O s (Emergency) with the relative rank of Flying Officer for employment with the R A.F : Winifred M. Bond, Hilda Brice, Esmé H M Gillieson, Kathleen M Harding, Joan S. Millett, Joan M Whiteman, Doreen Davies, Olive I Nicholson, Emily E E. E Hill, Jane S Weightman, Josephine H. Wood, Lillie L. Jackson, Nora Thomas, Joan I. Hallinan

ROYAL AIR FORCE VOLUNTEER RESERVE

Squad. Ldr. J. T. Linklater has resigned his commission and retains his rank

G T W. Cashell to be Squad Ldr (Emergency).

To be Fl. Lieuts (Emergency): F B Kiernander, D. A. Ropertson, R. J. Rutherford, and J. C. Hodgson

Fl. Lieuts A. L. Basham and E. D E E O'Brien have resigned their commissions

Flying Officers D. E Williams, R A. Mitchell, J N Williams, M J Hackett, J Allen, I R. C. Batchelor, C. B. Grimaldi, H. S Mason, J. Boardman, J. V. Braithwaite, T J Cockburn, J. S Fraser, A C Smerdon, J B Fawcitt, W. G. F Gibson, F. O Davies, A. H. Fairlamb, M. E. Gordon, C W. Lawson, A Livingston, K P. G. Mears, H L. Campbell, J. K Denham, W. F. Dickie-Clark, A A Smith, C M Miller, H. R. Rollin, T W. Robson, M. D. L. Finlay, R H. Armin, A C. Camm, J W Jackson, A. R. Silcock, W. H T. Shepherd, D G. MacNeill, N. W. R. Lucas, R. B. Walker, R D Sloan, D G B Richards, L H. Mattison, N T Brown, C. M. Carr, R E McLachlan, C. Bucknall, R E. Glennie, C A. Forrander, A Skene, J. M. Black P. A Dawes, R L Markham, R. M Douglas, H L B Girvan, H. S Boyce, P. S Davies, J M Russell, G. H Campbell, H Jefferson, B. A. D Stocker, G W E. Walker, G R. Bedford, H R L. Fraser, C. E. Waterman, G A. Beck, R. L Hill, A M. Thomson, A. M Turnbull, A J Abraham, R T Bevan, D Coueslant, W. F Hall, C M Mackenzie, H. V. Roberts, G P. Wood, H Goulden, S. Gruber, H V. Reeves, H L Roxburgh, E. S. Samuels, A. D. Maclean, W. E. Scott, J F Swan, W J. Weetch, G N Blackburn, R B Clayton, J. M. Dawson, E. N. Jenkinson, A. M P Laurent, D. U Macdonald, J. J O'Callaghan, L B Scott, J A. Sutton, E. Sanders J K McCabe W. L Price, and R G Derniss to be War Subs Fl. Lieuts

Flying Officer M F J. Clarke has relinquished his commission on account of ill-health

Flying Officer G. H. James has resigned his commission.

To be Flying Officers (Emergency): A C Barry, H. L. Joyce, R McAndrew, J. F. Bell, W L. Brace, T D Fraser, W E Grice, A. G. Richards, N. Sher, H D. Collins, J R Healy, J. C Mellor, A. Pearce, W N. Rollason, M. G. Simmons, G C. C. Wharton; J Ball, J R. Bryson, D A. Davies, H. D Freeth, K. MacI Mackenzie, A. R. V. Moynagh, J. Posner, J M. Thomson.

DENTAL BRANCH

Flying Officer W O Baird, M R C S, L R C P., to be War Subs. Fl. Lieut

INDIAN MEDICAL SERVICE

Lieut-Cols N. S. Jatar, C I E., D.S O., and M. A. Nicholson, C I E., have retired

EMERGENCY COMMISSIONS

Capts. V. M. Albuquerque and J. G. Stonham to be Majors.

The services of Lieut R. Kodandaram have been dispensed with on account of ill-health

To be Lieuts : R. A. Johnson, F. H. McCay, A. M. Kerr, J. D. C. Currie, G A. Ransome.

COLONIAL MEDICAL SERVICE

The following appointments are announced: J P Guthrie, M R.C S., L.R C P, and W. H. G. Patton, M B, Ch B, Medical Officers, Kenya; H S De Boer, M C, M R.C.S., L R.C.P., D.P.H, Director of Medical Services, Uganda; J F. Lucey, M B., B Ch, Medical Officer, Tanganyika Territory; C. Michie, M.B., Ch.B., Medical Officer, Sierra Leone

B.M.A.: Meetings of Branches and Divisions

EAST YORKSHIRE BRANCH

At the annual general meeting of the East Yorkshire Branch, held at Hull on May 8, Dr. T. MORTON J. STEWART gave as his presidential address, entitled "The March of Time," an amusing account of the changes he had seen in medical practice since leaving Edinburgh in 1915. The following officers were elected: *President and Representative in Representative Body,* Dr. N. Gebbie. *President-Elect and Honorary Secretary and Treasurer,* Dr. E. M. Dearn. *Vice-President,* Dr. C. Simpson. *Immediate Past-President and Deputy Representative in Representative Body,* Dr. Stewart. *Charities Secretary and Treasurer,* Dr. D. M. Mackay.

NORTH OF ENGLAND BRANCH

At a meeting of the North of England Branch, held in association with the Newcastle-upon-Tyne and Northern Counties Medical Society, at Newcastle-upon-Tyne on May 21, with Dr. F. W. GRANT in the chair, Sir CHARLES WILSON gave an address on "Morale." There was a good attendance, and a vote of thanks to the speaker, proposed by Dr. G. MUIR, was carried with enthusiasm. The lecture was preceded by a radiological demonstration in the radium department of the Royal Victoria Infirmary by Mr. C. J. L. THURGAR, Dr. D. RAMAGE, and Dr. M. WILLIAMS.

At a meeting of the North of England Branch, held in association with the Newcastle-upon-Tyne and Northern Counties Medical Society, at Newcastle-upon-Tyne on May 28, with Dr. J. N. TURNBULL in the chair, Prof. E. C. DODDS gave an address on "The Therapeutic Aspect of Endocrinology in General Practice." He stated that from the time of Galen until the 19th century glandular therapy had no rational basis. The first advance in endocrinology was the experimental production of diabetes mellitus by removal of the pancreas, followed in 1890 by the cure of a case of myxoedema by Murray of Newcastle, who had administered thyroid gland. Later crystalline thyroxine was isolated, identified, and synthesized. Insulin, being of a protein nature, presented greater difficulties to the investigator. Of the sex hormones testosterone, oestrone, oestradiol, and progesterone had been identified chemically and manufactured on a commercial scale. Stilboestrol and its allied products had been found to be more potent than oestrone or oestradiol in relieving menopausal upsets and inhibiting breast function. Sex hormone therapy had a definite use in medicine, but indiscriminate administration could not be approved. A vote of thanks to Prof. Dodds for his address, proposed by Dr. F. DICKENS, was enthusiastically supported by the meeting. The lecture was preceded by a physiological demonstration by Prof. D. BURNS and Dr. J. SECKER.

NORTH OF ENGLAND BRANCH: CLEVELAND DIVISION

At the annual general meeting of the Cleveland Division, held at Middlesbrough on May 22, with Dr. H. FALLOWS in the chair, the sum of £21 was voted to medical charities, three-quarters to the Royal Medical Benevolent Fund and one-quarter to Epsom College. It was agreed that the county council should be approached concerning an increase in the salaries of district medical officers of 20%. The following officers were elected: *Chairman,* Dr. W. B. Levie. *Vice-Chairman,* Dr. Fallows. *Secretary and Treasurer and Representative in Representative Body,* Dr. W. A. Kirkpatrick. *Assistant Secretary and Deputy Representative in Representative Body,* Dr. J. W. Ridley.

WAKEFIELD, PONTEFRACT, AND CASTLEFORD DIVISION

At the annual meeting of the Wakefield, Pontefract, and Castleford Division, held at Wakefield on April 26, with Dr. F. W. SULLIVAN in the chair, the officers were re-elected, with the addition of Dr. T. Walker as deputy representative in the Representative Body. The honorary secretary presented a report on the work of the Local Medical War Committee for 1941-2, and the committee was re-elected. Other matters before the meeting were the salaries of the police surgeon for Wakefield and the public assistance medical officers for West Riding and Wakefield.

POSTGRADUATE NEWS

The Fellowship of Medicine announces a revision course in anaesthetics, lectures 3 p m and 4 30 p.m., at Royal Cancer Hospital. Clinical Demonstrations daily at various London hospitals, from Oct. 5 to 17. The theory of physiology, eight lectures on Mon. and Thurs., at 8 p m. at 1, Wimpole Street, W., from Oct. 5 to 29, suitable for M R C.P, F.R.C S, and D A. candidates. Full particulars are available from the Fellowship of Medicine.

WEEKLY POSTGRADUATE DIARY

FELLOWSHIP OF MEDICINE 1, Wimpole Street, W — *Royal Chest Hospital:* Wed, 3 30 p.m, M.R C P. Course in Heart Diseases. *West End Hospital for Nervous Diseases* · Tues. and Fri, 3 p m., M R C.P Course in Neurology *Royal National Orthopaedic Hospital* · Sat (Sept. 14), 2 15 p m, Final F R C S Course in Orthopaedics. *St. Mary Islington Hospital:* Fri., 2 p m, Final F R.C.S Clinical Course. *Radcliffe Infirmary:* Daily, Revision Course in Anaesthetics. *National Hospital for Diseases of the Heart:* Tues. and Wed., 10 a.m, Out-patient Clinics.

ROYAL NATIONAL THROAT, NOSE AND EAR HOSPITAL. —*Fri*, 4 p m, Mr. N Asherson · Acute Mastoiditis.

BIRMINGHAM UNIVERSITY —At Medical School, Hospitals Centre, *Tues* and *Wed.*, 4 p m. Prof V. P. Sydenstricker: Nutritional Deficiencies and their Clinical Manifestations.

EDINBURGH POSTGRADUATE LECTURES —At Edinburgh Royal Infirmary, *Thurs*, 4 30 p m. Dr Charles Cameron: Differential Diagnosis of the Chronic Affections of the Lungs.

GLASGOW UNIVERSITY: DEPARTMENT OF OPHTHALMOLOGY —*Wed.*, Dr Paul Bacsich: Comparative Anatomy of the Retina.

DIARY OF SOCIETIES & LECTURES

SOCIALIST MEDICAL ASSOCIATION —At Conway Hall, Red Lion Square, W C., *Wed*, 5.30 p m. Prof. M Greenwood. Epidemiology and War.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.

DEATHS

HILL.—On August 28, at Hawick Cottage Hospital, Hawick, Scotland, after a short illness, J Macvie Hill, B Sc, D.Litt, of Wunoke, Green Hill Park, New Barnet, Herts, senior representative of the Crookes Laboratories, Park Royal, N W.10.

JOHNSTONE.—On September 1, 1942 (very suddenly), at his residence, 17, Moor Park Avenue, Preston, Lancs, George Gordon Johnstone, M C., M A, M D (Camb.), D.P H, beloved husband of Constance Johnstone and elder son of the late Thomas Johnstone, M.D., M R.C P, of Ilkley and Harrogate.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY SEPTEMBER 19 1942

British Medical Association

ANNUAL REPRESENTATIVE MEETING, LONDON, 1942

The Annual Representative Meeting, 1942, the first to be held since 1939, was opened in the Great Hall, B.M.A. House, London, on Tuesday afternoon, September 8, and continued during the following two days.

The principal business was the consideration of the draft Interim Report of the Medical Planning Commission (published in the *Journal* of June 20). The chair was occupied by Dr. H. G. Dain (Chairman of Representative Meetings), who was supported by Mr. H. S. Souttar (Chairman of Council and Chairman of Medical Planning Commission), Sir Beckwith Whitehouse (President of the Association), Dr. T. Fraser (Past President), Dr. J. W. Bone (Treasurer), and Dr. P. Macdonald (Deputy Chairman, Representative Meetings). Almost all the Divisions in Great Britain and Northern Ireland were represented, as well as the Oversea Branches of Otago (New Zealand), Victoria (Australia), and the Punjab, and there were four Public Health Service representatives.

FIRST DAY

Tuesday, September 8

In presenting the preliminary section of the Annual Report of Council (*Supplement,* May 30), Mr. Souttar referred to the loss of Sir Henry Brackenbury. He reminded the meeting of the long and eminent services he had rendered to the Association in a succession of high offices: "He has passed on full of years and honour, leaving behind him a great example." In a further personal word the Chairman of Council spoke of the arduous work carried out at the head office by Dr. Anderson and his colleagues, and the whole of the staff during the three years of war. In addition to the ordinary work of the Association they had had placed upon their shoulders the vast amount of work connected with the Central Medical War Committee and the Medical Planning Commission.

ASSOCIATION FINANCE

Dr. J. W. Bone presented the financial statement for 1941. The membership was now at its highest peak—over 41,000—though, in spite of this, the revenue from subscriptions was slightly down, owing to the reduced subscriptions from serving members. The Association's liabilities had been reduced and there were ample reserves to meet all contingencies. The value of the Association building was about £750,000, and its available space was fully let. The amount of rent received last year was £12,700. As for the future, it appeared that the financial position for the current year, barring accidents, would reveal a substantial credit balance.

Dr. A. Beauchamp (Birmingham) asked the meeting to express the opinion that the payment by the Government towards the expenses of the Central Medical War Committee was very inadequate. He believed that the actual expenses were £17,000, and the amount provided by the Government was £7,000. Dr. W. D. Anderson (Glasgow) and Dr. C. I. Schiff (City of London) spoke to the same effect, the latter asking why the Association should bear any part of the cost of what was a Government obligation. Dr. Bone replied that while the Government allocation was not generous, the Council regarded the Association's financial contribution as a donation to the war effort, also as a contribution to the medical profession as a whole by the members of the Association, and finally as making possible a valuable piece of Association work. The Birmingham resolution was carried.

GENERAL PRACTICE

The National Fire Service

Dr. S. Wand, chairman of the General Practice Committee, gave a review of his committee's work during the year, especially in relation to the recommended increase in medical fees and to certification.

Dr. J. A. Moody (Stratford) moved to refer back certain paragraphs of the report relating to the pay of Fire Service medical officers, on the ground that the system whereby Post Office medical officers were given the specified duties, solely in the light of their Post Office appointment, was inequitable, and also that the capitation fee for certain members of the Fire Service (12s. with dispensing) was too low. He gave instances in which arrangements for medical attention for firemen, which had obtained satisfactorily for years, had been upset in favour of the new arrangement whereby the Post Office doctor was given the work. Dr. R. W. Rae (North Staffordshire) spoke to the same effect. He knew that they would be told that the firemen were a selected group of people of a healthy type, who, if they became chronically ill, were discharged and pensioned; but it was a wrong principle. Dr. Howie Wood (Isle of Wight) said that the scale of payment for the National Fire Service compared unfavourably with the payment under National Health Insurance—9s. 9d., plus 3s. 3d. for medicine. Moreover, the Fire Service M.O., like the Post Office M.O., had to visit within three miles without extra charge, whereas for insurance patients the distance was two miles. Dr. E. A. Gregg suggested that it was unwise to cite the capitation fee for N.H.I. as a standard for anything.

Dr. Wand, in reply, said that his committee was promised that existing arrangements would not be interfered with, and every case in which such interference had been alleged had been taken up. As regards the 12s. capitation fee, this was a specially picked body of men, regular firemen before the war, part of whose emoluments was the provision of medical benefit. There were no "chronics" among them, and there was no certification or record-keeping as insurance practitioners understood it. He believed the 12s. fee to be equal to about 20s. for N.H.I. patients.

The Stratford motion was carried.

Dependants of Serving Men

Several motions called on the Council to ask the Government to extend medical benefit to dependants of men serving with the Forces. The Secretary (Dr. G. C. Anderson) said that for the past two years or more representations had been made to the Government Departments concerned and the same answer had always been made, that the Government was not prepared to make the provision which was asked.

Dr. F. H. Bodman (Bristol) moved to express dissatisfaction with the Government reply and to instruct the Council to press again on the Government the urgent needs of Service dependants. Any general practitioner or out-patient physician was aware that the dependants of civilians had never been so well off in their lives. With the disappearance of unemployment and the existence of high wages, war bonuses, and overtime payment, these people were consulting their private doctors and calling in consultants with the greatest ease. But the dependants of Service men told a different story. Here was the beginning of a new depressed class. In many cases the families of Service men had had to move out of their houses into furnished rooms, the mother had to supplement her family allowances by going out to work, and the health of the children suffered. The Government's reply was that in the great majority of cases the pay and allowances provided by the Service Department should be sufficient to provide the cost of treatment; but in fact it was only a small minority of these people who could afford it.

Dr. Wand, on behalf of the Council, accepted the Bristol resolution, which was supported by Dr. Margaret Martin (Edinburgh) and carried.

Reservation of Maid-servants and Dispensers

Dr. F. E. Gould (Birmingham), as one who had been "part-time domestic servant" for some months past, moved that the Council be asked to persist in its efforts to safeguard doctors' interests by securing the reservation of at least one maid in each doctor's house and doctors' dispensers. By "reservation" he implied "essential occupation." His reference to "at least one maid" had in view the case of branch surgeries.

The Secretary said that since the calling-up of women began to be a serious matter for the employer at the beginning of this year, inquiries on this subject had been received from perhaps 200 members. During the past three months the matter had been actively pursued with the Ministry of Labour and National Service, and the Ministry had consented to give special consideration to any case where the doctor was experiencing difficulty owing to the absence of domestic or secretarial assistance or where for some reason a dispenser had been called up when he should not have been. Fifty cases had been referred, with in many instances satisfactory results. Here or there a case had not been made out. A doctor, for example, could hardly claim to retain a maid if there were in his house two or three daughters not otherwise employed. The Ministry was "playing fair" and was prepared to investigate any cases brought forward. The local interviewing boards had been instructed by the Ministry not to withdraw dispensers from the doctor's service. As far as secretaries were concerned, each case must be considered on its merits. The Birmingham motion was carried.

Dr. MONA MACNAUGHTON (Newcastle) did not think the motion went far enough. The method Dr. Anderson had described was a cumbersome one, and she moved that the responsible authority be asked to give the same consideration to the exemption from military and other services of domestic staff employed by private doctors as was given to similar staffs in hospitals. The local office of the Ministry of Labour should have power to direct a maid to a doctor's service. Dr. WAND said that he was prepared to accept this motion. He pointed out that District Man-power Boards could not receive representations regarding the deferment of clerks employed by bureaux associated with Local Medical War Committees or Public Medical Services unless these people had first satisfied some Ministry that they were in an essential occupation. This was a matter which the General Practice Committee would have to take up. The Newcastle motion was carried.

NATIONAL HEALTH INSURANCE

Dr. E. A. GREGG (chairman of the Insurance Acts Committee) said that the Ministry of Health was not prepared to admit that practitioners had a case for a further increase in the capitation fee. This question was still being pursued with the Ministry, and a communication had just been received from them which, had it not been for the present meeting, would have been considered by the Insurance Acts Executive Committee that week. During the past year his committee had been concerned with matters of reorganization. It was felt that some of the difficulties which insurance practitioners experienced were due to a failure to maintain a satisfactory contact between the centre and the periphery. An endeavour was being made to strengthen the linkage. It was proposed that the I.A.C. be enlarged by six additional representatives to be chosen by the Annual Panel Conference and by one further direct representative who would be allocated to Scotland so as to enable the elections in that country to be made on a satisfactory territorial basis.

The motion amending the constitution of the Committee in the manner described was carried. Dr. A. BEAUCHAMP (Birmingham Central) urged that the additional six members should all be engaged in insurance practice. Dr GREGG replied that there was no suggestion that the six should be other than active insurance practitioners, and he accepted a motion to that effect.

Dr. E. M. TUSTIN (East Somerset) moved that no member of the I.A.C. should serve for more than five years consecutively. This would be a means of introducing new blood into the committee. Dr. GREGG said that a resolution of this kind was likely to raise nearly as many difficulties as it attempted to cure. He did not think it would be a good thing for the Representative Body to deal with a question of this kind, which ought to be left to the Panel Conference. There was no reason why the mover, if there were difficulties in his own group, should not endeavour to secure there a limiting condition of this kind without imposing it upon the whole country. The motion was lost.

The Insurance Capitation Fee

The CHAIRMAN said that a number of motions had been submitted relating to the capitation fee. He suggested that the Representative Body should refer these to the Council with a view to their consideration by the Insurance Acts Committee and the Panel Conference. It was always a false step for the Representative Meeting to interfere in negotiations which a committee of the Association was at that moment carrying on.

Dr. GREGG said that with a slight modification he would welcome a motion put down by the City of London:

> That this meeting reaffirms the dissatisfaction expressed at the last Annual Representative Meeting with the capitation payments under National Health Insurance and calls upon the Council to continue to press this question upon the Government.

Dr. C. I. SCHIFF (City of London), in moving the resolution in these terms, said that it seemed to him necessary that the Representative Body should year by year, until the capitation fee was satisfactorily adjusted, continue to express publicly its dissatisfaction. The public still remained under the impression that the doctors were making a "good thing" out of National Health Insurance, and it should be made clear that in the opinion of the profession they had never been dealt with in such a manner as would have made the system a thoroughly efficient one. The motion was agreed to.

MEDICAL PLANNING COMMISSION

Statement by the Chairman

The meeting then turned to the discussion of the draft Interim Report of the Medical Planning Commission. The motions and amendments on the paper relating to this subject numbered about 170, and to many of the motions the names of a large number of Divisions were attached.

Mr. H. S. SOUTTAR (Chairman of Council and of the Commission) said that the Commission was set up by the Council after a very careful selection of its members. The planning which it undertook was of the greatest complexity and members were chosen for their aptitude and experience in dealing with these problems. The report, which was the result of a year's hard work, had not been considered by the Commission as a whole: it would be so considered later in the light of what the Representative Body decided. The tendency of the discussions in the Commission had been towards an appreciation of the value of co-ordination in general practice. It was believed that in future individual doctors would no longer work in isolation, they would work in groups, and the Commission desired advice as to how those groups might best be formed. One method of grouping, around health centres, had been worked out in some detail. The health centre was not an entirely new idea; it was developed 20 years ago by the Dawson Committee, but it had now been elaborated more fully. Some felt that if health centres were set up they might provide for general practitioners many of the advantages enjoyed by consultants in relation to their hospitals. The discussions had also envisaged a co-ordination of hospitals. There was a very general feeling that it was absurd to continue with several distinct types of hospitals working independently, and that the voluntary and municipal hospitals must in some way be co-ordinated, an ideal that had been greatly advanced by the work of the Nuffield Committee which was exploring the problem of regionalization. Several possible solutions to the various problems were put forward in the report of the Commission. Some favoured a whole-time State salaried service and others an expansion of national health insurance, and there were plans intermediate between these two, but it was of the utmost importance to have the opinions and criticisms of a representative body of the profession on these points.

The CHAIRMAN said that the questions on which it was hoped to obtain a definite reply from the Representative Body were the following: (1) free choice, (2) group practice, (3) whole-time versus part-time service, (4) the inclusion of the whole community or only a section of it in the provisions, also methods of administration and conditions of service.

Motion for Deferment until after the War

Dr. C. J. GROSCH (Wandsworth) moved: "That no decision for or against any form of change of medical practice should be expected until victory has been achieved." Hasty action, he said, would probably cause division in the Association. Large numbers of doctors, mainly the younger men, had gone into the Services, having left their practices, sometimes with mortgages upon them, and naturally they were anxious lest, by some decision taken in their absence, they should find when they came back to civil life that the capital as represented by the goodwill of their practices had disappeared. His Division was willing to accept any change in medical service which was thought necessary during the war so long as it did not serve as a precedent to their disadvantage after the war was over.

Major R. SCOTT STEVENSON (Marylebone) supported the Wandsworth motion. He said that the lips of the men in the Services were sealed: they were prevented from saying anything about the future status of their profession. He believed that those men would resent it if such a meeting as that were to decide in their absence the structure of medical practice for the next generation, though they would resent it even more if their civil colleagues sat and did nothing while other people outside decided the structure for them.

The SECRETARY said that a few months ago a medical man attached to a unit in this country where a number of medical men were stationed wrote that he had arranged a meeting to discuss these matters but had been told by his commanding officer that while they might hold their discussions they must not transmit their findings to anyone. He (Dr. Anderson) immediately took up the matter with the Director-General of Medical Services, pointing out the vital necessity of obtaining the views of the men in the Services, and asked him to issue an instruction to the Commands that meetings of medical members of the Forces should be allowed and that any conclusions they came to might safely be transmitted to the Secretary of the B.M.A. Therefore Major Scott Stevenson was not quite correct when he said that officers were debarred from transmitting the results of their discussions.

Major SCOTT STEVENSON: That has not percolated down to the people in the lower ranks of the Service to which I belong.

Dr. F. GRAY (Council) pleaded for a fair deal for the men on active service. How was it possible for such men to take a fair and adequate part in such discussions? Yet these were the men who would feel the full effect of any decisions taken, for they would remain in practice for years after the great majority of the people in that meeting had retired. What Wandsworth was moving would in no way interfere with the consideration to be given to the report of the Commission. Dr. N. F. MOLONEY (Council) said that before the end of the war some scheme should be in existence, otherwise a scheme, and possibly a reactionary one, over which the profession had no control, would be prepared for them. Dr. D. V. M. ADAMS (Lanark) thought that if the Wandsworth proposal were agreed to the work so laboriously done by the Commission would come to nothing. The interests of the men on service were in the special charge of the men at home.

Dr. W. E. DORNAN (Sheffield) said that public opinion and doubtless also the opinion of the Government on this matter of health services were being moulded by other bodies; therefore there was the greater need for concrete proposals to be put forward by the profession. If nothing were done now the position after the war would be that thousands of young men, released from the Services, would find themselves unemployed, with no chance whatever in such circumstances of striking a bargain with any Government that might be in power. Dr. O. C. CARTER (Bournemouth), who also spoke against the Wandsworth proposal, pointed out that a very large proportion of the young practitioners on service had been without experience of civil practice, and those of them who were older would be doing their younger colleagues the greatest possible service by planning ahead. The absent men would like to know to what sort of practice they would presently return, instead of having to anticipate a condition of chaos and uncertainty. The education authorities and industrial organizations were planning for the future, and the Government itself did not consider the present time inopportune for reconstruction.

The Wandsworth motion was lost, and a similar motion by Halifax urging that there should be no change in current medical practice until all absentee practitioners were home again was lost also.

Definition of Objects of Medical Service

The meeting proceeded to the consideration of the seven questions set out in Section V of the draft Interim Report of the Commission. The CHAIRMAN moved, as the answer to Question 1:

That the following broad definition of the objects of medical service be accepted: (*a*) to provide a system of medical service directed towards the achievement of positive health, of the prevention of disease, and the relief of sickness; (*b*) to render available to every individual all necessary medical services, both general and specialist, and both domiciliary and institutional.

In making the formal motion, which was in the name of over 40 Divisions, the Chairman said that he hoped no time would be wasted in debating the abstract term "positive health." Dr. J. B. MILLER (Council) said that the phrase "positive health" was a telling one and to jettison it would be a psychological error. It drew attention to a preliminary statement which many might not otherwise consider. Dr. W. V. HOWELLS (Swansea) emphasized the value of providing all necessary medical services for the individual. For some years he had endeavoured to get a pathological service established for insured persons but had failed. An amendment by Cleveland and other Divisions to delete the phrase "positive health" was lost, and the general motion approving the broad definition was accepted.

Free Choice

The CHAIRMAN moved, again formally, as the answer to Question 2 the following words standing in the name of 34 Divisions:

That free choice of doctor and patient is an essential feature of any future service.

Dr. H. W. BOWYER (Bolton) moved to substitute "important" for "essential" in the motion. It would be unwise, he said, for the profession to fetter itself with such an inelastic attribute as "essential" in connexion with free choice. Circumstances might arise in which the scope of free choice would be limited. In order to provide a 24-hours and 7-day service rotas would have to be set up and assistants provided, and under such arrangements free choice might become very limited. Moreover, if grouping of practices came into existence the tendency would be for individual doctors in a group to concentrate on certain aspects of medical practice, and it might be to the general advantage for a patient to receive his treatment from one specially qualified member of the group without much relation to free choice. Dr. T. CRAIG (Newcastle) said that 99% of the doctors in this country had been selected as the result of free choice of their patients, but, of course, it would be recognized that free choice had some common-sense limits. Dr. J. C. ARTHUR (Gateshead) said that his Division wished to urge that steps be taken to extend free choice to any class of the community to whom it was not already available. Free choice was regarded as one of the fundamental rights of the individual. Dr. A. T. ROGERS (Bromley) said that by tying themselves to the word "essential" their movements in any future service would be restricted. The amendment by Bolton to substitute the word "important" for "essential" was lost.

Dr. C. M. SCOTT (Barnet) urged that free choice would be an essential feature in any future service but should be subject to the proviso that regulations existed to prevent the "will-o'-the-wisp" tactics at present employed by some patients. He had in mind patients who, for trivial reasons, sought change of doctor at frequent intervals.

Dr. C. W. SOMERVILLE (Lothians), on behalf of several Divisions, moved: That in any reorganization of general practice as full a measure as possible of free choice of doctor and patient should be preserved. This was offered in substitution for the word "essential." Dr. J. H. STEPHEN (Aberdeen) said that if they were to consider the possibilities of group practice in the long-term policy which was being planned then the question of free choice came in in quite a large way, and he thought the amendment just moved by the Lothians furnished the necessary margin to allow for the cases in which free choice was not practicable. The Lothians amendment was carried and was also adopted as the substantive motion, so that the answer to Question 2 was:

That in any reorganization of general practice as full a measure as possible of free choice of doctor and patient should be preserved.

Group Practice

The CHAIRMAN again formally moved, as the answer to Question 3:

That group practice should be a feature of any future medical service.

He said that two problems were embodied in this, that of group practice, and—subsidiary but important—that of the nature of the health centre. Group practice might be an extension of present partnerships, and might be considered apart from the health centre question. He asked representatives to discuss group practice first and to defer health centres to a later stage.

Dr. G. PRIESTMAN (Bradford) moved to add the words "but not an essential feature." Dr. T. CRAIG (Newcastle) favoured group practice, but insisted that it be entirely voluntary, without departmental interference, and under the control of the doctors concerned. Dr. W. YEOMAN (Harrogate) feared that if group practice were considered as an essential of the service the profession would lay themselves open to have it forced down their throats whether they wanted it or not. Dr. P. INWALD (Council) asked if anyone was prepared to affirm that individualistic methods of practice were achieving results which ought to be expected in modern medicine. He mentioned some of the effects of isolation, such as the waste of time and effort involved in a number of doctors visiting the same area, perhaps the same street. Doctors had become so much preoccupied with competitively making a living out of their practices that they tended to become mere dispensers of medicine and signatories of certificates, without proper opportunity for leisure or for undertaking postgraduate or research work. Yet it would be possible co-operatively to arrange reasonable hours of duty and provision for night and emergency calls.

Dr. S. WAND (Council) said that with doctors working together the patients got better advice and treatment. If a consultant found it necessary to call in the advice of another consultant, it was obvious that a general practitioner, desiring an independent opinion, should be able to call in a colleague. If it was agreed that group practice was a desirable thing for the patient then it must be regarded as an essential feature of the scheme, for, unless it were so regarded, independent and individual practice would still go on.

Dr. C. F. T. SCOTT (Willesden), while favouring voluntary group practice in the sense of practitioners co-operating together, was sceptical of the value of any rigid system of groups imposed from outside. Dr. W. W. Fox (Council) said that if it was their opinion that a number of doctors working together would produce better results than by working alone, then the principle of group practice should be supported, and the subjective reactions of some who said that they did not like to work with a number of other doctors ought not to be regarded.

The amendment to add the words " but not an essential feature " was lost, but a further amendment by Harrow was adopted, namely:

> That group practice should be a feature of any future medical service, provided that it does not involve the introduction of supervisory control in clinical matters.

Dr. J. E. Gaze said that the Harrow Division was greatly in favour of group practice, but wanted to emphasize the need for control by the doctor concerned of the treatment of his patients and to establish that principle at the outset. An amendment by Reigate affirming that group practice on a voluntary basis should be a feature of any future medical service was withdrawn in favour of the Harrow amendment.

Dr. McWhan (S.-E. Counties of Scotland) moved as an extension of the motion already carried that in any future medical service group practice should be encouraged in areas where it was suited to local conditions. The Chairman pointed out that no one would imagine that the Commission desired to impose group practice where it was not suitable. In reply to a question, he said that it would be, to begin with, in selected areas. This motion was withdrawn, and a motion that group practice should be tried in selected and contrasting areas for a period of five years in order to estimate its strength and weakness was lost.

Dr. J. C. Arthur (Gateshead) moved:

> That group practice should be a feature of any future medical service, but the groups should not be formed arbitrarily by any outside authority; they should be arranged by the doctors themselves.

He agreed with the general principle of group practice, but he objected to coercion into it by any outside authority. The Gateshead idea was that these group practices should be run by themselves, possibly with suggestion and help from headquarters, but financially controlled groups should be avoided.

Sir Kaye Le Fleming said that on reading, for the first time for several years, an important report under the auspices of the Association in the preparation of which he himself had had no share, he had formed certain general impressions, one of which bore distinctly on this question of groups. To his mind the report as a whole drew too much attention to measures which were going to be introduced by somebody somewhen and somehow, and did not dwell enough on the power to effect co-operation or to bring about reform which existed in their own profession without any stimulus from outside. They were all agreed that the group system was likely to be good for the public, but no group system could be really good unless those who took part in it were ready and willing to work together. A group system could not be forced on an area where men were not prepared to co-operate. A group system did in fact exist, in major or minor ways, in various parts of the country, and the sooner they got down to working together in a group form the sooner the public would derive benefit and the less time it would be necessary to waste on discussions such as the present.

The Gateshead amendment, that any groups should be arranged by the doctors themselves, was carried. The answer to Question 3, therefore, was that group practice should be a feature of any future medical service—the original proposition—modified by the amendments of Harrow and Gateshead, that group practice must not involve the introduction of supervisory control in clinical matters, and that the groups should not be formed arbitrarily by any outside authority.

The report of the debate on Medical Planning will be continued in our next issue.

The B.M.A. and the World Situation

On the last day of the meeting two resolutions of general import were moved from the chair and carried unanimously and with acclamation. The first of them read:

> That this Representative Meeting of the British Medical Association sends to its medical colleagues in the U.S.S.R. its warmest greetings and its heartfelt appreciation of the fine part they are playing in the magnificent struggle of the Russian peoples against the common enemy.

It was agreed that this be conveyed to the Russian Ambassador, M. Maisky. The second resolution read:

> That the Representative Body, realizing that vast and urgent measures for the control and treatment of preventable diseases will be needed on the Continent on the cessation of hostilities, (1) pledges its full support in the task of organizing and administering the necessary relief measures, and (2) asks the Council, in collaboration with Government and international relief agencies, to take early action so that the necessary organizing, administrative, and coordinating measures should be fully prepared beforehand.

H.M. Forces Appointments

ROYAL NAVAL VOLUNTEER RESERVE

Prob. Temp Surg. Lieuts A. O. John and J S. Law to be Temp Surg Lieuts.

ARMY

Lieut-Col. F. C K. Austin, from R A.M.C, to be Col

ROYAL ARMY MEDICAL CORPS

The following Majors to be Lieut-Cols: (Temp. Col.) G. T Gimlette; (Temp Lieut-Col) W. Millerick, M C.; C. A Slaughter and H A. Boyle

Capts. (Temp Majors) R A. Smart and G M. Robertshaw and Capt. S F. Cranston, short service officers, have been appointed to permanent commissions, retaining their present seniority.

The notification regarding Capt. H N Walker in the *London Gazette* dated Aug. 16, 1940, has been cancelled Capt H N Walker has retired on account of ill-health, receiving a gratuity

Short Service Commission.—Capt N. F. Field has been placed on the half-pay list on account of ill-health.

REGULAR ARMY RESERVE OF OFFICERS

Major-Gen. W H. S. Nickerson, V C., C B., C M G, late R.A.M C, having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

Royal Army Medical Corps

War Subs. Capt L. Godlove, from temp commission, to be War Subs. Capt., retaining his present seniority.

TERRITORIAL ARMY, R.A.M C.

Supern. for Service with Birmingham Univ., Senior Training Corps (Medical Unit).—Major R. J. S. McDowall has ceased to be employed

WOMEN'S FORCES

Employed with the R.A.M C.

War Subs. Capt. F. B C Livingston has relinquished her commission on account of ill-health.

ROYAL AIR FORCE VOLUNTEER RESERVE

Fl. Lieut. F. H. King has resigned his commission and retains the rank of Wing Cmdr

To be Fl Lieuts (Emergency): G. G. Lennon and R. W. Tannahill

Flying Officers J. C. Garland, A. M. Abrahams, G. O Richardson, E. H. L. Cook, and J. F. Rickards to be War Subs. Fl Lieuts.

To be Flying Officers (Emergency): M. C. Bell, P. G Epps, R. A. House, G. H. B. Roberts, P. Q. M. Spaight.

REMUNERATION OF SHIP SURGEONS

As was reported in the *Supplement* of June 20, the British Medical Association has recommended to the Ministry of War Transport that, as a wartime measure, ship surgeons should receive a basic salary comparable with that of junior medical officers in the Services. As this matter is under the control of the individual shipping companies, the Ministry forwarded the Association's recommendation to the Employers' Association of the Port of Liverpool, which has brought it to the notice of its members, and to the Shipping Federation, which has advised direct representations by the B.M.A. to the company concerned in any particular case. The Secretary of the B.M.A. will be glad to hear from any ship surgeon whose remuneration is not in accordance with the recommendation made.

POSTGRADUATE NEWS

The Fellowship of Medicine announces: Final F R C S clinical instruction, Weds., 5 30 p m, from Sept. 30 to Oct 28, cases will be demonstrated in the wards of a centrally situated hospital, Sats, Oct. 3 and 24, 2 30 p m, clinical teaching will be given at the same hospital; cases will be examined by postgraduates and then demonstrated

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s 6d This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.

BIRTH

Smith.—On September 7, to Jean, wife of Lieut Wm Clark Smith, R.A.M.C, Fair View, Long Newton, Stockton-on-Tees Co. Durham, a son.

DEATHS

Ireland.—On August 30, 1942, from typhoid fever, in the Middle East, Capt Patrick G L Ireland, younger son of Dr. Aubrey Ireland, Shrewsbury.

Younie.—At Calcutta, suddenly, on Sept. 9, 1942, John Younie, Indian Civil Service, beloved husband of Dorothy Younie, M.D., Glenvar, Dollar, Scotland.

SUPPLEMENT TO THE

BRITISH MEDICAL JOURNAL

LONDON SATURDAY SEPTEMBER 26 1942

ANNUAL REPRESENTATIVE MEETING

SECOND DAY

Wednesday, September 9

INTERIM REPORT OF MEDICAL PLANNING COMMISSION

(Debate Resumed)

The Extent of the Provision

On the resumption of the Annual Representative Meeting on September 9, with Dr. H. G. Dain in the chair, a debate took place on the fourth of the questions set out in Section V of the draft Interim Report of the Medical Planning Commission: "Should provision, whatever its character, be made by Government for the whole community, or for a part of it only? If the latter, to which section of the community should it be limited?" The Chairman, following the agreed procedure, formally moved: "That provision, of whatever character, should be made by the Government for a section of the community only." An amendment stood in the name of 19 Divisions as follows:

> That provision, of whatever character, should be made by the Government for the whole community.

Mr. H. J. McCurrich (Brighton), in moving this amendment, said that a service covering so wide a field was comparable with the education service, which was open to the children of all citizens, though there was no compulsion to take advantage of the State service. If extension of National Health Insurance came about only 10% of the population would remain outside its provision, and to set up an enormous organization for the exclusion of the 10% of ineligibles seemed unnecessary.

Dr. A. T. Rogers (Bromley) supported the amendment. His Division felt that there was much to be said for the inclusion of the whole population in any form of practice agreed upon for the future. If the amendment were rejected it meant that the profession reserved the right to "exploit" the one-tenth who would be outside the scheme. Dr. P. Inwald (Council) said that in New Zealand, some of the Scandinavian countries, and Russia the whole population was included in medical benefit, with no disadvantage to the common health. The Government must have the right to provide for the whole country. Dr. E. S. Pasmore (Kensington) was unable to support either the motion or the amendment. The view of his Division was that provision should be made available by the Government, but not necessarily provided by the Government, for the whole community. Dr. S. W. Swindells (Grimsby) said that it would be ludicrous to equip clinics for a national service and then declare 10% of the population to be debarred. Dr. D. G. Morgan (Cardiff) thought that any hesitancy as to the Brighton amendment might disappear when it was remembered that in the municipal services provision was made for the whole community. Dr. Armstrong Harris (Westminster and Holborn) said that if 10% of the population were left out there would be a tendency for a number of doctors to leave the scheme alone and undertake private practice. This would be regrettable because it might give rise to a feeling that it was the best doctors who had stood out.

Sir Kaye Le Fleming, who said that the debate had surprised him, asked whether it was likely that any Government which undertook to introduce a scheme of medical services would scrap all the existing machinery and begin *de novo*. The aim in view was to see that every member of the community got a full medical service at a proper economic cost, but that could not be done all at once, and in this country we moved by evolution, not by revolution. It was clear to him that development would come about as a result of the State becoming more and more responsible for different groups of the population. He thought the Brighton amendment impracticable and likely to tie their hands in future discussions. Dr. W. W. Fox (Council) asked how it could be called a revolution if the provision for the majority of people was already in existence and was extended to the remaining 10%. Dr. D. F. Whitaker (Guildford) said that exactly the same arguments were used against National Health Insurance on its introduction in 1911. It was said then that no change at all was desired by the medical profession; but the Act had now been running for 30 years and no responsible body of opinion had as yet asked for its repeal. Was the medical profession prepared to allow that there should be two services in this country, one for the people who had a lot of money, and the other for the rest? He claimed that the younger men in the profession were in favour of provision for the whole community. Dr. S. Wand (Council) begged members to be realists. If provision were made for 90%, there was no need to include the remaining 10%, who were quite able to provide it for themselves. Dr. A. Phillips (City of London) asked what was the reason for suggesting the exclusion of the 10%. Was it that the profession wished to continue a certain amount of "exploitation"? The profession, especially during the last 30 years, had been steadily evolving in the direction of Government control, and there was no reason why this should not continue until the whole community was included in Government provision.

Dr. J. C. Arthur (Gateshead) said that this country had been well served by evolutionary methods; it had never been fond of revolution, which perhaps explained why it had the most stable Government in the world to-day. It had been stated that a scheme which brought in 100% of the population was still evolutionary, but it seemed to be assumed that 90% were already in the scheme, which was far from being the case. If dependants of the insured population were now brought in a very considerable step would have been taken, and if it proved satisfactory they could afterwards go further. Dr. A. Lucas Young (Eastbourne) said that his Division believed that in any system of medicine which might be adopted after the war the medical service provided should be available for the whole community, but not that the actual provision or the organization thereof should be carried out by the Government. Mr. McCurrich, replying on the amendment, complained of certain bogies which had been brought out. He could not see that the extension of the benefit to the whole community was any more of a revolution than the introduction of the Education Act, 1870

The Brighton amendment: "That provision, of whatever character, should be made by the Government for the whole community," was put to the vote, with the result:

For 94
Against 92

The Chairman: Your very divided opinion will pass to the Commission for its consideration.

Mr. Mark Fraser (Cumberland) moved as a rider to what had just been carried: "That the patient should have the right to contract out and the doctor the right to charge fees for attendance to patients not on his list." This was carried.

Questions were raised from the meeting as to whether it had been intended to include hospital service in the Government provision mentioned in the Brighton motion. The Chairman was of opinion that the words "of whatever character" must be taken to include hospitals. Dr. N. E. Waterfield said that he thought there were many in the meeting who, like himself, did not understand the position. The emphasis in the debate had been on general practitioner services, and no one had mentioned hospitals. The majority in favour of the Brighton amendment was only two, and if he had understood that it was meant to include hospital services, he for one would have voted in the opposite direction. The Chairman said that he could not allow the question to be reopened on the plea that the issue had not been precisely defined.

Principle of Payment for Medical Services

Dr. C. M. Scott (Barnet) moved: "That whatever Government provision may be made in agreement with the profession, the principle of payment for medical services, excluding public assistance, either directly or through contributory or insurance schemes, should be maintained." Dr. D. C. Barron (Sheffield) supported the motion. Payment should be made for services rendered, whether in a health centre or in any other way. Whatever the provision, there would always be more than one class participating. There would be a very poor class, such as those now on public assistance; a large class able to pay for their services by reason of their regular contribution to some insurance scheme; and, over and above these, a third class able to afford private fees. No scheme should be adopted which made it possible to preclude the payment of fees by those able to pay them.

The CHAIRMAN said that as it had been decided that the services should be provided by the Government, he did not see how they could say that it should be paid for by those included in the provision. But he would allow the motion to be put. The motion was carried.

Debate on Whole-time State Service

The meeting next came to Question 5, which asked whether the basis of the services should be the extension of the type of benefit under National Health Insurance, the establishment of a whole-time salaried Government medical service, or some other method. The CHAIRMAN decided to take a straight vote on a motion in the name of Bromley and three other Divisions:

> That the basis for the co-ordination and integration of health services should be the establishment of a whole-time salaried Government service.

Dr. A. T. ROGERS (Bromley), in moving this, admitted that his Division was not nearly so agreed on this motion as on the motion just carried. The point which swayed them in its favour was that if group practice—already agreed to by the meeting—came in, its success would depend on amicable agreement among those working it, and such agreement was likely to be imperilled if there was constant competition for payment and patients were earmarked for one practitioner in the group or for another.

Dr. C. O. STALLYBRASS (Liverpool) moved to delete the word "Government" from the Bromley motion. The word meant either too much or too little, and to avoid confusion it should be left out. Either it meant a whole-time service run directly from Whitehall under regulations—which was the last thing they wanted—or an organization by the Government of the service only in its main basic principles, with the administration in detail left to some other body. Prof. R. M. F. PICKEN said that "Government" meant Government, whether central or local. If there was to be a salaried service it must be provided by some form of governing body. To delete the word "Government" would be to cloud rather than to clarify the issue.

The Liverpool amendment was lost, and discussion continued on the Bromley motion.

Dr. H. W. POOLER (Chesterfield) said that in effect the Commission's report envisaged a State Medical Service. One point of some importance was the loss of goodwill which the Commission's "scheme" would occasion. Practitioners would have no voice in the choice of their successor to what would probably be the main part of their practice—namely, that conducted at the health centre—and there was no guarantee that the successor to that part of their practice would be willing to buy what remained of their private practice. He regretted that the Commission had missed an opportunity of cutting out two evils which beset them at the present time. One of these was the evil of having to decide, with considerable embarrassment, as to the certification of the work-shy and hypochondriacal person. If practitioners were made independent of this through a whole-time service they would be able to deal with the position very much better. The other evil was the unfortunate atmosphere of suspicion and jealousy which did exist, whatever might be said about it, and seemed likely to be perpetuated in some form in the health centres.

The CHAIRMAN reminded Dr. Pooler that the Commission had made no decisions of any kind. It had furnished suggestions on which it was open to the present meeting to make decisions.

Dr. J. A. L. VAUGHAN JONES (Leeds) said that there was a steady and increasing move towards nationalization or socialization of essential services, partly owing to the dictates of war emergency, but also to a general reorientation of ideas. One example was the limitation of profits, which might eventually lead to the elimination of the purely profit motive. The war had strengthened the tendency to place all major security burdens, including health, upon the State. There was no need to elaborate the deficiencies of the present system, but it must not be forgotten that the public also was conscious of them. There were three main arguments against a whole-time salaried service. The first was a supposed loss of personal initiative and incentive. A great deal of nonsense had been talked about this. It had never been proved that whole-time teachers of medicine or medical officers of health suffered from a lack of initiative. The second argument was a supposed loss of free choice. But such loss was not peculiar to a full-time salaried service. A recent analysis of the statutory social services made in connexion with the Beveridge Committee showed that free choice of doctor so far as National Health Insurance was concerned was more apparent than real. When a practice changed hands only 10% of insured persons exercised their right to change their doctor, and even that 10% included those who had meanwhile moved to other districts. The third argument was the "soul-destroying effect of democracy," but this the speaker was prevented from demolishing by the expiration of his time limit.

Dr. A. PATTON (Leigh) said that in his Division the large majority of opinion at first was in favour of whole-time State service as against an extension of National Health Insurance, but when the interim report of the Commission was published in June several members rather changed their views and the majority in favour of a State service was quite small at the finish. What was strongly felt was that in any scheme medical control should be ensured to the fullest extent that was reasonable.

Dr. C. I SCHIFF (City of London) said that his Division would view with favour the establishment of a State Medical Service freely available to the whole population. Such a service must, however, function with a minimum of bureaucratic control, and there must be adequate remuneration for doctors, who should be provided with pensions on retirement, holidays with pay, fixed hours of work, facilities for postgraduate study, and compensation for loss of existing practices. A State Medical Service was bound to come about. Events were tending in that direction whether the profession liked it or not. Here was an opportunity to take Time by the forelock and to show that they themselves were capable of forming an organization which would be economical of energy, preserve professional dignity, and serve to the best advantage the people of this country.

Dr. J. M. HUNTER (Londonderry) supported the extension of the present system. While the doctor might be in a better position under a State Medical Service, the patient would not be better off. The National Health Insurance system had many faults, but it had worked well under great difficulties, and to scrap it would be a great mistake. Free choice was bound to be interfered with to a greater extent under a State service than under an extension of National Health Insurance. Mr. H. J. MCCURRICH thought that the meeting was in danger of reaching a decision which would negative the principle of contracting-out to which it had already agreed. If doctors were in a whole-time State Medical Service how would contracting out be possible, at least in country districts? In large towns, no doubt, certain doctors would continue to do private practice only. Dr. P. INWALD urged that the profession must not put itself again in the position of its forerunners who in 1911 opposed National Health Insurance because of the fear of the future. Such an attitude would leave them unprepared when the Government introduced its own scheme, and their plight would then be an unenviable one. Dr. F. M. ROSE (Preston) said that it was forgotten by some speakers that a long-term policy was being planned and that the money relationship between doctor and patient was at present one of the greatest difficulties. It was not that patients did not pay their bills, but that sometimes the doctor felt that he was not giving to his fee-paying patients the service they ought to have because he was afraid that they might think that by making extra visits he was merely running up the account against them. It might be argued that the money relationship could be ended by an extension of National Health Insurance, and so it could to a certain extent, but not as fully as in a State service, in which the question of one patient more or less would not affect the doctor financially.

Dr. F. GRAY (Council) said that he greatly admired the idealism of the speakers who had advocated a State Medical Service, but he begged the meeting to come down to earth, and preferably to earth at the lower end of Whitehall, because that was where they would have, in fact, to consider the Government side of a salaried service. The profession had more experience now of Government methods than had their predecessors thirty years ago. National Health Insurance had been in existence for 29 years and the Ministry of Health for 23. What was the experience of them from the point of view of the patient and the doctor? The record of the Ministry could be summed up by saying that it was out to secure the cheapest possible service. Some time ago Sir Kingsley Wood, when Minister of Health, talked about a "national medicinal thirst." In a State Medical Service was it not likely that instructions would be issued to the profession to limit prescribing along certain lines?

Sir KAYE LE FLEMING said that for something like twenty years he had heard this problem debated, and had never heard but one answer to it. What were the advantages it was hoped to secure by a whole-time State Medical Service? Security, leisure, pensions. Very well, they could have them, but they would have to pay for them and what were they going to pay? What was the salary going to be? He drew attention to the way in which Government Departments remunerated the medical services of the Army, the Navy, and so on. From this it would be seen to what range of salaries they might aspire. They would lose liberty to practise as they liked, and they would be servants of the Government, which had never shown any great interest in the welfare of the profession. The public did not want such a system, the present meeting would show that the profession did not want it, and he believed the Government did not want to start it if they could help doing so. There was a risk of State salaried service arising under economic pressure, and if as and when the State took responsibility for looking after the health of wider sections of the public the demands which the profession made for remuneration were too high the Government might say, "Well, after all, it will pay us to put in the whole-time salaried man, and there will always be a minority of the profession ready to take these posts."

Mr. McAdam Eccles asked whether hospital services were to be considered as included in the motion. If they were it would mean that the voluntary hospitals would have to be run by State salaried staffs. The Chairman replied that the proposals would apply to every member of the profession who took part in the service, whether in general practice, in hospital, or in whatever it might be.

Dr. T. Craig (Newcastle-upon-Tyne) spoke of the sacrifice of freedom which a whole-time service would entail. "If you are prepared to sacrifice all that for the sake of sitting pretty with a salary, well, it is up to you." Dr. W. W. Fox said that if the profession did nothing about it a State Medical Service would eventually come about in this country; and, imposed from without, it would not come up to the standard which a medical profession should demand. When the war was over there would be many thousands of doctors coming back to this country looking for practices, and these might form a nucleus which the Government might use for the introduction of a State service for which the profession was not prepared. Dr. N. E. Waterfield said that before the war he was fortunate enough to visit Soviet Russia and make an inspection of the medical services of that country. It was the general experience of the visitors that Russian general practitioners were very much dissatisfied with the State medical service, and were doing their best to get out of, at any rate, a part of it. (Cries of "Question" and "Quite true.") In addition, the patients themselves were dissatisfied with the service, and private practice was being allowed in order that they might have the opportunity of getting the doctor of their choice.

The motion: "That the basis for the co-ordination and integration of health services should be the establishment of a whole-time salaried Government service" was put to the meeting and lost by a huge majority. There were demands for a count, which resulted:

For	20
Against	177

The result was greeted with loud cheers.

Dr. C. M. Scott (Barnet) had a long resolution on the agenda, which in large part fell to the ground on account of previous decisions, but the Chairman allowed him to move the last clause of it, which read: "That the contracting doctor should be guarded against exploitation by his patients by some statutory or financial protection." He said that if dependants of insured persons were to be included there should be some kind of protection for the doctor against unnecessary work. This amendment was not designed to discourage seekers after "positive health" but to save the doctor from trivial calls.

The motion was agreed to in the form of a recommendation to the Planning Commission for consideration. Further motions on the question of the basis of future health services were held over for the later debate on health centres.

The Plan in Broad Outline

The Chairman next directed the attention of the meeting to the sixth question set out in Section V of the report: "Should the plan set out in broad outline be accepted in its present or an amended form?" The points arising were: administration, central and peripheral; health centres; unification of hospitals; and appointment of practitioners to the service. He moved formally that the plan in broad outline in the draft report be adopted, to which there was an amendment by Shropshire and Mid-Wales:

> That the plan in broad outline in the draft report of the Commission be adopted only in so far as it relates to changes in central and local administrative and advisory machinery and to unification of hospitals under a regional body.

Dr. J. A. R. Ireland, in moving the above, said that his Division accepted the suggestions in the report under "Administration," and with regard to hospitals it felt that the hospital system should be brought together under a regional body which would be able to get the best both out of the voluntary and out of the rate-aided and State-aided hospitals.

The Chairman: If this amendment is adopted it rules out the possibility of health centres. Dr. Ireland: My Division is against health centres.

Dr. H. S. Pasmore (Kensington) said that his Division was prepared to give this motion its support for the main reason that it did not commit them to the health centres as described in the report. They would prefer the health centre to be confined to pathological and radiological services and the like. It seemed as if the health centre as visualized in the report would be a glorified out-patient department, and the model described seemed to be inconsistent with the close personal relation between doctor and patient on which the Association had always insisted. It was also assumed that ten or twelve doctors in compulsory association and in competition for a capitation fee would co-operate and work amicably together, when in fact it was difficult enough for three or four partners in a voluntary association to do so.

Dr. A. Beauchamp (Birmingham) hoped that the meeting would not pass the Shropshire amendment. In Birmingham the question of health centres had been gone into very thoroughly and the opinion by an overwhelming majority on a plebiscite was that health centres were desirable in such a city. There would be no regimentation, the centres would not be glorified out-patients' departments, but places where practitioners could carry on their practices very much as now but with better facilities. A health centre would be started in his area, probably very soon. In Birmingham the doctors already worked in co-operation; they were very good friends, and although there was competition it was of a healthy kind. Dr. S. Wand endorsed the remarks of his Birmingham colleague, and asked the meeting to reject this amendment and to debate health centres on their merits.

The mover of the Shropshire resolution consented to delete the word "only," so that it no longer implied disapproval of health centres, and in this form it was carried.

Health Centres

The discussion on health centres took place on an amendment by Gateshead: "That the proposals relating to the establishment of health centres be not approved." Dr. J. C. Arthur, in moving, said that what was not approved was the arbitrary setting up of health centres as set out in the report. His Division did not entirely disapprove of the health centre idea. It felt that the idea was perhaps worthy of exploration, but that before any definite conclusion was reached such centres should be tried out experimentally in some selected areas. The initiation of such a centre should be in the hands of the doctors of the area.

Dr. C. W. Somerville (Lothians) said that in his country district they were strongly in favour of the idea. In his country town there were only four resident doctors, but the doctors in outlying villages were anxious to take advantage of the centre for consultation with their colleagues, and one doctor who was strongly in favour of it lived twelve miles from his nearest medical neighbour. The centres should have laboratory equipment and possibly *x*-ray outfits. Dr. J. G. Thwaites (Brighton) said that his Division looked upon the health centre as an integral part of a future health service for the nation. The centres should not be left to experimental or haphazard growth, but organized efficiently and completely. He hoped also that auxiliary services would be attached to the centre—for example, nurses and health visitors—and that the centre might have provision for certain physical treatments and a theatre for minor operations. The dental services might be usefully combined with the centres.

Dr. T. Craig (Newcastle) supported the amendment. At two meetings in the Newcastle Division the subject had been considered at great length. Those for whom he spoke were not in favour of consultations by specialists taking place at the centre. The ideal of a health centre was the ideal doctor's surgery. Dr. S. Wand (Birmingham) said that he was asked at a meeting in his area why he thought health centres superior to a form of group practice carried out in the surgeries of individual doctors. He regarded them as superior on clinical, economic, and social grounds. As to the first, he reminded the meeting that they had been asking for years for work which as general practitioners they could most properly perform and which had been taken away from them and placed in other hands by the local authorities. But to do this work, as to do much else in modern medicine, required the fullest co-operation between general practitioners themselves and between general practitioners, consultants, local authority medical officers, and those in ancillary services, each section of the profession with every other section. Was it not best to do it in a place where all these people could meet together? He was satisfied that the cost of the building was not an insuperable difficulty. Not only could the buildings be provided, but the profession could arrange for their provision if necessary. As for the social advantages, he felt that if the gallery at that meeting were filled with their wives and families the heartiest acclamation at the idea of health centres would come from that quarter, because it would be realized what a relief they would mean to the doctor's household. If the health centre idea were not accepted he could foresee a time when the best they could hope for would be that the local authorities would take away more of their work, and the worst, that some other body would come and say, "You have no constructive ideas; you must do as we say."

Dr. R. W. Rae (North Staffordshire) said that his Division had passed a resolution that health centres were feasible only in a full State service, but the full State service had been turned down by that meeting. He thought that in their consulting rooms and surgeries they had enough equipment and accommodation for dealing with their patients. Radiological work should go to the hospital. Dr. J. G. McCutcheon (Glasgow) spoke of the domestic advantages which health centres would bring. They would enable the doctor to live in a different and much more private house, and his difficulties in procuring a locumtenent during temporary absence would be greatly eased. In his ordinary work it would be of inestimable advantage just to be able to tap at a door and ask a fellow doctor to step in and confirm his finding.

Dr. T. W. Turner (Guildford) spoke of the advantages of group practice. He liked working with other people. He had had more help from his fellow general practitioners than from the "pundits." Indeed, such help, when requested, had never been withheld. Dr. Howie Wood (Isle of Wight) said that his Division was very much in favour of the health centre. One of the reasons which weighed with many of them was consideration for their wives. He believed that if a census of opinion of doctors' wives were taken it would be found that there was universal support for the idea of practice away from home. The domestic difficulty was accentuated by the maid problem. Dr. S. W. Swindells (Grimsby) said that mere grouping of doctors, unless done under the authority, would not be recognized for such purposes as infant welfare.

Dr. F. W. Grant (South Shields) said that what the Commission recommended was a statutory scheme of health centres. On the previous day the meeting had agreed to group practice as a feature of any future medical service, but the groups were to be arranged by the doctors themselves, and now they were asked to agree to a chain of statutory health centres in which the groups would not be formed, for the idea of setting up statutory groups had been refused. Dr. A. Staveley Gough (West Herts) said that the committee of his Division was against the general establishment of health centres, but in favour of the experimental establishment of some centres and of further study of the subject. Some districts did not need health centres, in others they would take the form of diagnostic clinics, and in others again their chief purpose would be for consultation. A controlling body, such as a regional council, with a medical majority, should decide where and in what form health centres should be established in its area. Dr. W. N. Leak (Mid-Cheshire) was opposed to the establishment of health centres, although the idea was attractive in many ways. What his constituents feared was that they would be too governmental in character. There was no guarantee that a short while after these centres had been established consultants would not come along "and every case of stomach-ache would call for the gastro-enterologist." The care of the patient should be in the hands of the general practitioner, and his hands should be strengthened as much as possible.

Dr. F. Gray (Council) said that there was some danger in this discussion of the subject being confused by a mass of detail. The scheme set out in the interim report was not the only one. Several speakers had expressed grave doubts as to that scheme, and, speaking as a member of the Commission, he had grave doubts himself. In fact the actual scheme in detail was, he believed, unworkable. But it must not be supposed that any scheme was therefore unworkable.

The Chairman pointed out that in paragraph 69 of the interim report reference was made to ". . . a health centre which would be provided by a statutory health authority." He did not want to have the idea of a health centre turned down because of a difficult word like "statutory" at this stage, because there was no body at the moment proposing to set up a service of statutory health centres. It must be expected that the service would be tried out by some means or other in a number of districts, and he gathered that opportunities for so doing were likely to occur before long.

In order to get a straight vote from the meeting the Gateshead amendment was waived in favour of a proposition moved by Dr. Wand, seconded by Dr. Inwald, "That the principle of health centres be approved," and this was carried by a considerable majority. The Chairman said that he took it that the meeting would not wish to go into more detail at the moment. Prof. Picken suggested that the Commission would wish to have the opinion of the Representative Body on its proposals, and eventually the following was proposed formally from the Chair—

> That the plan in broad outline so far as it affects health centres set out in the draft Interim Report of the Medical Planning Commission be adopted—

to which an amendment was moved by Dr. J. C. Arthur (Gateshead) that the words in paragraph 69 referring to its statutory character be omitted. His object in moving this was to make sure that the meeting did not commit itself to any cut-and-dried scheme of health centres. They had to decide whether there should be erected all over the country a series of expensive buildings in which general practitioners had to work. It might be desirable that that should be done, but he did not think it desirable that the meeting should advocate such a concrete scheme, which would have to be paid for by some outside authority. No scheme of the kind should be approved until there had been a full experimental investigation. While they approved health centres in principle they objected to this suggestion in the report that the choice should be a statutory form of health centre. It would be better to have experimental health centres run by the doctors themselves. It was a form of activity which might well be undertaken by the B.M.A.

The Gateshead amendment was lost, and the original motion approving in broad outline the plan for health centres as set out in the report was carried.

ELECTIONS

In the course of the meeting the results of elections were announced as follows:

Chairman of Representative Body—Dr. Peter Macdonald.
Deputy Chairman—Dr. J. B. Miller.
Treasurer—Dr. J. W. Bone.

Twelve members of Council elected by grouped representatives:

Group (1) Dr. J. A. L. Vaughan Jones, (2) Prof. A H. Burgess, (3) Dr. H. W Pooler, (4) Dr. J. A. Brown, (5) Dr. W. E. Thomas, (6) Dr. E. A. Gregg, (7) Dr. F. Gray, (8) Dr. O C. Carter, (9) Dr. N. E. Waterfield, (10) Dr. J. Hunter, (11) Dr. J. G McCutcheon, (12) Dr. W. Lyle.

There were contests in Groups (6), (8), (9), and (11).

Eight members of Council elected by representatives voting together:

Mr. W. McAdam Eccles, Dr. F. M. Grant, Sir Kaye Le Fleming, Dame Louise McIlroy, Sir Ewen Maclean, Dr. J. C. Matthews, Dr. L. A. Parry, Major R. Scott Stevenson.

Elected by the Annual Representative Meeting to represent the R.A.M.C. on the Council, Major-General R. W. D. Leslie; and to represent the R.A.F.M.S., Air Marshal Sir Victor Richardson. (The Council was empowered to elect the representatives of the R.N.M.S. and the I.M.S.)

[Owing to paper restrictions and the necessary publication in our next issue of the annual report of the Insurance Acts Committee the debate on medical planning will be held over until Oct. 10]

ANNUAL GENERAL MEETING

The statutory annual general meeting of the Association was held on Wednesday, September 9, in the Great Hall of B.M.A. House in London. The chair was taken during the first part of the proceedings by the retiring President, Dr. Thomas Fraser of Aberdeen.

The Secretary read the notice convening the meeting.

The minutes of the annual general meeting held in London on September 11, 1941, which had been published in the *Journal*, were approved and signed by the President.

Induction of New President

Dr. Fraser then introduced his successor, Professor Sir Beckwith Whitehouse. He mentioned the circumstances of the Aberdeen Meeting of 1914, when he was hon. secretary, which was overshadowed by the outbreak of war, and the Aberdeen Meeting of 1939, when he was President, which was followed swiftly by the present war. His presidency, unduly prolonged, had not been a very happy period owing to the extra burden he had had to carry in his private practice with the calling up of his partner, and to the increasing difficulty of travel, which made participation in the central affairs of the Association a very trying matter. He was glad that a younger man, living nearer to London, was to follow him. He spoke of Sir Beckwith Whitehouse's distinguished career and his popularity in the Midlands, where he carried on his practice. He then vacated the chair in his favour and decorated him with the badge and chain of office.

Sir **BECKWITH WHITEHOUSE**, who was received with loud applause, said that he wished that this ceremony could have taken place in his city of Birmingham, and that the Annual Meeting might have been held there, as had been anticipated for 1940, with the customary pageantry and entertainment. It would be his constant duty to uphold the dignity of the profession and to look after the interests of the Association and the public it served.

The **SECRETARY** read a letter which he had received from Sir Beckwith Whitehouse that morning stating that as there was to be no entertaining at this year's Annual Meeting he had felt that he would like to send a cheque for 100 guineas to be credited to whatever fund was felt to be most deserving of their attention at the present day. (Applause.) The Secretary added that after consultation with the Chairman of Council and Treasurer it had been decided to place Sir Beckwith Whitehouse's generous donation to the credit of the Sir Charles Hastings Fund.

Election of Auditors

On the motion of Sir Beckwith Whitehouse, seconded by Dr. C. F. T. Scott, Messrs. Price, Waterhouse and Co. were reappointed the Association's auditors until the next annual meeting, at a fee of 300 guineas.

Vote of Thanks to Past President

The **CHAIRMAN OF COUNCIL** (Mr. H. S. Souttar) proposed a hearty vote of thanks to Dr. Fraser for his services to the Association. He referred to the splendid reception which was given to the Association at Aberdeen and to the many occasions since then on which the President, often with great difficulty and even personal discomfort, had come down to assist their deliberations in London.

The resolution was carried with loud applause.

President's Address

Sir **BECKWITH WHITEHOUSE** then proceeded to read a short Presidential Address, which is printed at page 357 of the *Journal*.

The **CHAIRMAN OF THE REPRESENTATIVE BODY** (Dr. H. G. Dain) proposed a vote of thanks to the President, who, he said, had offered many suggestions of great value, which would assist them in the consideration of the large issues they were at present debating.

This vote of thanks was also heartily accorded and the meeting terminated.

St. Dunstan's (wartime address: Church Stretton, Shropshire) is responsible for the hospital treatment and rehabilitation of members of the fighting Services, the Merchant Navy, and of the police, fire, and Civil Defence Services, who are blinded through the war. Civilians who are thus blinded receive treatment in an E.M.S. hospital to which an ophthalmic surgeon is attached. The National Institute for the Blind has undertaken the rehabilitation of blinded civilians, whose welfare in general is the responsibility of county and county borough councils. Hospitals in the Emergency Hospital Scheme should therefore notify the National Institute (224, Great Portland Street, London, W.1) before civilian blind are discharged; they should also notify the local authorities of the areas in which such persons propose to live (Ministry of Health Circular 2630).

Correspondence

General Practice and National Health

SIR,—One is always glad to find the importance of the work of the general practitioner appreciated in something other than vague terms by those in the position of Mr. Wilfrid Adams (*Supplement*, Aug. 29, p. 21). My object in writing is to thank him and to support some of his arguments and not to criticize, except in one minor point.

When I started practice, a long time ago, the abrupt change from hospital to private routine presented many difficulties, such as the many extra calls on time, the want of someone at hand to consult, equipment, and, worst of all, the want of beds and of nurses to carry out one's orders. Mr. Adams rightly says that the role of the general practitioner is early diagnosis and effective treatment. When the G.P. starts practice he has had no experience of the former, as nearly every patient he has seen in hospital has been suffering from a more or less established disease or disability, the earliest stages of which have to be found in the consulting room or in the homes of the people. And how is he to give effective treatment in many cases without the help of the hospital? He must often despair that he cannot, for want of bed, nurse, or equipment, give the treatment that he knows that his patient ought to have at times when it would be most effective; he acquires some of these requisites in time, but he is still too often in want of a bed both for cure and for diagnosis. In many areas there are to-day small local hospitals, though in some of these too many of the beds are occupied by patients under the care of members of the staff of the central hospital.

As to early diagnosis, I do not agree with Mr. Adams, if I read him rightly, when he objects to means of special investigation and treatment at the doctor's premises. Surely one of the advantages of doctors working in a group would be that one of them might carry out special lines of treatment, such as ultra-violet radiation, electrolysis, CO_2 snow, etc. Another might do urine testing, blood counts, and various microscopical investigations, all of which should be within the competence of any doctor who might choose to undertake them, and which are not only invaluable for early diagnosis and treatment but add greatly to the interest of one's work.

Mr. Adams appreciates the value of the family doctor's talks on health to his patients. I believe that these, given in the surgery or in the homes of the people, are the only sort of lectures that get at the right people and at the right time. For some years now these domiciliary talks have been given with excellent results by district nurses, as those can testify who have practised long enough to see the changes in the homes of the working classes. I believe such talks are of more value than all the official health lectures, because they have on each occasion a practical application and are given to those who cannot or will not attend formal lectures. If the nurse, why not the doctor?

May Mr. Adams's hope be fulfilled—that the general practitioner will take a share in the work of the M.O.H. but without too strict control; for as Lord Dawson has recently written, "Individualism will not flourish easily within the rigid boundaries of a State service." We know that authority, schools of medicine, and fashion all tend to make progress difficult.—I am, etc.,

Bath CHAS. E. S. FLEMMING.

The Absentee Doctor

SIR,—A regular feature of the correspondence on the future of medical practice has been the wish that no decision be taken till after the war, when serving practitioners may have an opportunity of expressing their opinion. Letters have appeared from doctors in the Forces deprecating any radical change, and looking forward to the time when they can return to conditions very similar to those they knew. One is tempted to think that these doctors have left their practices in care of partners or assistants, and that they confidently anticipate resuming control of lucrative practices after cessation of hostilities.

It might be well, however, to consider the position of those doctors who, working single-handed and trusting to the efficacy of the B.M.A. Protection of Practices Scheme, have closed their practices completely on enlistment. The scheme *has* prevented the irretrievable transfer *en bloc* of a panel to neighbouring practitioners; it *has* secured payment to an absentee doctor of a portion of his panel fees, though these steadily diminish every quarter; and, judging by the admonishing notices received periodically from the bureau, it *has* secured payment of a ridiculously inadequate sum representing private fees. Cessations from insurance and removals from the district ensure a steady diminution in the size of the absentee doctor's panel, and absolutely no provision has been made to maintain the numbers on his list. Theoretically it may be possible for an acting doctor to accept a new panel patient on behalf of an absentee practitioner, and to treat him provisionally, but I very much doubt if such acceptances have ever been made. The scheme allows for any patient accepted during the war to change to a doctor returning from the Forces, after the termination of hostilities, but one cannot believe that many will exercise this privilege. Failing any change in the system, therefore, the returning doctor can expect to find himself the possessor of a fragment of a practice, on which he may still owe a large sum of money.

This state of affairs should have been foreseen, and might have been prevented by various measures—e.g., the arbitrary allocation of a certain proportion of the new entrants or arrivals in a district to absentee doctors, the care of these persons being provisionally undertaken by the acting doctors. This would have avoided a precipitous decline in a doctor's list, and a steady diminution in the value of the quarterly payments. Whether it is too late to amend the scheme to rectify this injustice is a debatable point. In any case these circumstances should be borne in mind in the event of compensation being paid for practices; and in fairness to these men, and incidentally to those doctors who practise in devastated areas, the pre-war value of a practice should be that on which compensation should be paid. Such returning doctors will demand financial rehabilitation, and will resent being so handicapped in unrestricted competition with neighbours who have remained firmly established during the war years. They will no doubt welcome any scheme that provides security from financial embarrassment, and will not view with such distaste as has been exhibited by many, a State Medical Service.—I am, etc.,

London, N 15. LIONEL B. LIEBSTER.

Co-ordination or State Control?

SIR,—I note with interest a report in the *Daily Telegraph* of a meeting of the Association held in London on Sept. 9 from which the following sentence purports to be a quotation of one of the speakers—"Neither the people of this country nor the bulk of the medical profession desire to become regimented units of a system of bureaucratic control." How truly this sentiment is echoed by all classes of the community can be ascertained by discussions at any hour of the day or night, and it is to be hoped that we shall now see an end to the supine attitude of the profession which has taken it for granted that a State Medical Service is both desirable and inevitable.

It should be patent to any student of modern politics (by which I mean a system of governing the country) and of modern economics (by which I mean a system of book-keeping) that there are much simpler ways of providing the best medical service for the community than by the fascist method of State control. By all means let us have co-ordination which can best be carried out by the State, but let us remember that Great Britain is supposed to be a democratic country fighting for democratic principles, and that once the shackles of obsolete finance and autocratic government have been removed the problems which are so prominent to-day will disperse like the morning mist warmed by the rising sun. —I am, etc.,

W. SAYLE CREER,
Manchester. M Ch Orth., F.R C.S.

COLONIAL MEDICAL SERVICE

The following appointments are announced: R A. Allen, M.B, Ch.B., and G A. Mott, M.B., B Ch, Medical Officers, Gold Coast; H. W. Forshaw, M B., Ch B, and J A. B. Nicholson, M B., Ch.B., Medical Officers, Nigeria; H N Reed, M B, B S., Medical Officer, Tanganyika Territory; J. E. O'N Gillespie, M D., Medical Officer, Trinidad; G. N. Samuel, M B., Ch B, Medical Officer, Sierra Leone; R H Georges, L R C S, L R.C P., District Medical Officer, Antigua, Leewards; M A W Roberts, M.B, B.Ch., Surgical Specialist, Nyasaland

POSTGRADUATE NEWS

A short course of lectures on common skin diseases will be held at St John's Hospital for Diseases of the Skin, 5, Lisle Street, W C, on Tuesdays, Sept 29 and Oct 6, 13, and 20, and Thursdays, Oct 1 and 8, at 4 30 p m The lectures are free and are open to medical officers of all the Allied Forces, graduates, and undergraduates Details will be announced weekly in the postgraduate diary column of the *Supplement*

WEEKLY POSTGRADUATE DIARY

BRITISH POSTGRADUATE MEDICAL SCHOOL, Ducane Road, W—*Daily*, 10 a m. to 4 p m, Medical Clinics, Surgical Clinics and Operations, Obstetrics and Gynaecological Clinics and Operations *Daily*, 1 30 p.m. Post-mortems *Tues*, 10 a m, Paediatric Clinic; 11 a m., Gynaecological Clinic. *Wed.*, 11.30 a m., Medical Conference. *Thurs*, 2 p m, Dermatological Clinic *Fri.*, 12 15 p m, Surgical Conference; 2 p m., Gynaecological Conference; 2 p m., Sterility Clinic.

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W.—*St Mary Islington Hospital:* Wed. 2 p.m, Final F R.C S Clinical Course *London Homoeopathic Hospital:* Wed, 5 30 p m., Final F.R C.S. Clinical Surgery Instruction. Sat (Oct 3), 2.30 p.m, Final F.R C S Clinical Teaching *National Hospital for Diseases of the Heart:* Tues. and Wed., 10 a.m., Out-patient Clinics

ST. JOHN'S HOSPITAL FOR DISEASES OF THE SKIN, 5, Lisle Street, W.C—*Tues*, 4 30 p m. Dr. H Corsi: Scabies and Parasitic Infections. *Thurs.*, 4 30 p.m. Dr. W Griffith Bullous Eruptions

GLASGOW UNIVERSITY: DEPARTMENT OF OPHTHALMOLOGY.—*Wed.*, Prof. A. J Ballantyne: Pathology of the Retinal Veins *Thurs.*, Mr E. Wolff: Normal Histology of the Retina *Fri.*, Mr. Wolff: Pathological Histology of the Retina.

DIARY OF SOCIETIES & LECTURES

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C—*Thurs.*, 3.30 p m Dr. Beatrice D. Pullinger: Experimental Tumours and Trauma

BIOCHEMICAL SOCIETY—At Department of Biochemistry, South Parks Road, Oxford, *Sat* (Sept. 26), 11 30 a m Communications.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.

BIRTHS

FRESHMAN—On Sept 15, 1942, at The Green, Wingham, nr. Canterbury, to Tress, wife of Edgar Freshman, F R C S, a daughter.

LE VAY—On July 27, at Ripley, to Esther (*née* Wyndham), wife of Lt. H. Le Vay, R.A M C., a son (Michael John)

MCLAREN—On September 18, to Margaret, wife of Capt. G. N. McLaren, R.A.M.C., The Poplars, Neasham Road, Darlington, a son

The Ministry of Health states that some doctors are still using the old *National Formulary* which was superseded on December 1, 1941, by the *National War Formulary*. Since this not only causes inconvenience to patients and chemists, but also in many cases means a waste of drugs which are in limited supply, doctors are asked to cease using it, and to conform with the rule that no preparation should be prescribed by title alone unless that title appears in the *B.P.*, the *B.P.C.*, or the *National War Formulary*.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY OCTOBER 3 1942

British Medical Association

REPORT OF INSURANCE ACTS COMMITTEE, 1942

1. Five meetings of the full Insurance Acts Committee have been held during the past session. In the interval between meetings the work of the Committee has been conducted by an Executive Commitee which has met on six occasions.

Constitution of Committee

2. The constitution of the Committee has been changed by (*a*) an increase from 26 to 27 direct representatives of Local Medical and Panel Committees; (*b*) the elimination of representation of the Association of Local Government Medical Officers; and (*c*) the election of 6 members by the Annual Conference of Local Medical and Panel Committees. The procedure governing the election at the Annual Conference is set out in a new Standing Order which the Conference is being asked to approve.

Recommendation A.—That the following addition be made to the standing orders of the Conference:

> *Election of six members of the Insurance Acts Committee:* For the purpose of this election "Representative" shall be defined as the duly appointed representative of a panel committee, or, in his absence, the deputy duly appointed in his stead in attendance at the meeting.
>
> Nominations may be made only by representatives, and a representative may make not more than one nomination. Only practitioners actively engaged in National Health Insurance practice are eligible for nomination.
>
> Nominations must be handed in, on the prescribed form, before noon of the first day of the Annual Conference, the voting, if necessary, taking place during the afternoon session. Only appointed representatives or deputy representatives in attendance at the meeting are eligible to vote.
>
> The Insurance Acts Committee shall be empowered to fill casual vacancies occurring among the elected members.

Insurance Capitation Fee

3. The various resolutions passed at the Special Conference on July 31, 1941, were sent to the Ministry of Health, and have been noted for suitable action by the Committee at the appropriate time.

Wartime Bonus

4. Panel Committees are aware of the action taken by the Committee in submitting an application for a wartime bonus for insurance practitioners. The memorandum which formed the application was submitted to Panel Committees, and was subsequently revised by the Committee after considering their observations. It was then forwarded to the Committee's legal advisers for their comments on the substance of the memorandum and for their suggestions in regard to its presentation to the Ministry. Ultimately, the memorandum was forwarded to the Ministry substantially in the form in which it was prepared by the Committee (*Supplement*, July 4, 1942). On July 14 the Ministry replied as follows:

"The Minister of Health has had under consideration your letter of June 24 asking for a further increase in the capitation fee payable to insurance practitioners in order to compensate them for the increase which has taken place in the cost of living since the beginning of the war.

"In reply I am to refer the Insurance Acts Committee of the British Medical Association to previous correspondence on this matter, including your letter of May 15, 1941, in which it was stated that 'the Committee is prepared to withdraw this part of its claim until adjustments to meet the higher cost of living are made in the remuneration of others with comparable income.'

"It is still the policy of the Government that increases in remuneration to meet the increase in the cost of living should not be granted to classes of persons whose incomes are similar in amount to those of insurance practitioners, and the Minister regrets therefore that he is unable to accede to the Committee's request."

5. The Committee was profoundly dissatisfied with the Ministry's reply, and immediately asked for a meeting between the two parties with a view to amplifying the Committee's application. Such a meeting was arranged, and subsequently the following letter (dated Aug. 14) was received from the Ministry of Health.

Copy of Letter from Ministry

"I have now had an opportunity of putting very fully to the Minister the views expressed by you and your colleagues when you came to see me on July 23. It may be convenient if I set out here what I believe to be the chief points which you wished me to bring to his attention by way of supplementation of Dr. Anderson's letter of June 24. You stated very emphatically that insurance practitioners were increasingly dissatisfied with their position; that they had conceived themselves as partners with the Ministry in the promotion of a positive health policy; that instead of being treated as such they had been driven by successive actions of the Ministry into what was frankly described as an attitude of hostility to the Department, and that this deterioration of relations dated from the proceedings before the Arbitration Tribunal of 1937. It was said that not only the result of that arbitration but also the method of presentation of the Ministry's case before the tribunal had been resented by the profession. That resentment had been deepened by the action of the Ministry in refusing in 1941 to entertain an application for an increase in the capitation fee on the ground that it would require legislation. This ground of objection, it was alleged, was taken at a time when legislation was actually being drafted which not only permitted of the amount of the fee being raised, but introduced, without consultation with the profession, additional classes of the population into insurance.

"It was into this background that you set the claim of the insurance practitioners that they were entitled to more generous treatment, and the case was amplified by statements of the additional burdens of work placed upon them without any corresponding increase in their remuneration. Reference was made not only to the bonuses granted, with the approval of the Minister, by local authorities to their officers, including their medical officer, but also to the increases of remuneration secured by the industrial workers, including managerial staffs. You agreed that there was no accurate or statistical measure of the increased work of practitioners, and suggested that such validity as the prescription figures may have had as an index of work no longer obtained, since doctors, for various good reasons, partly of necessity and partly of choice, were inclined less and less to give prescriptions for minor ailments and more and more to rely on suitable advice. There were more of these minor ailments about, and some of your colleagues stated that their summer surgeries were now as frequented as their winter surgeries used to be. All this, it was suggested, indicated a need for a more generous approach by the Ministry to the capitation question than had hitherto been in evidence, and you made it clear that you did not wish the matter to be dealt with merely as one relating to a cost-of-living bonus.

"As I said, I have put your supplementary arguments, which I hope I have set out adequately, to the Minister, and he has given the most sympathetic consideration to the views of the deputation.

"In reply, I think I ought to deal first with certain matters which belong to the background of history to which you referred. As I tried to explain to the deputation, the method of proceeding by way of arbitration leads insensibly to an atmosphere of litigation which is not in the best interests, or to the liking, of either party, and we are agreed, I think, that this is one of general questions of procedure to which a great deal of thought must be given in relation to the future. Since I saw you I have taken the opportunity of re-reading the shorthand notes of the evidence given on behalf of the Department, and I am bound to say that I cannot find anything in the evidence beyond what was necessary to support the Department's case, which was, as you know, not that the insurance doctors were in any way deficient either in skill or in zeal, but that the progress of medical science since the last award had not in fact added to the burden of general practice but had had, if anything, the contrary effect.

"Coming to nearer matters, I found it necessary, as you know, to rebut the suggestion that the Ministry were unfair in their attitude in 1941. I think I ought to put it on record that at the date when the Committee's original application for an increase in the capitation fee was rejected, the question of immediate legislation was not, in fact, under consideration, and that as soon as legislation was decided upon negotiations were at once opened. Let me also clear up another point which seemed to be an occasion of affront to the deputation—namely, our approval of bonuses to local authority officers, including the M.O.H., with salaries over the current Civil Service bonus limit of £500. I hope I convinced the deputation that with certain exceptions the Government have no power to interfere with the salaries paid by local authorities to their officers, and that this element of freedom from central control is regarded, and rightly regarded, by local authorities as an important matter of principle. It is true that medical officers of health are in a special position in this matter, but after full consideration the view was taken here that it would be unfair to single them out and use the powers of the Department to exclude them from the benefit of a general policy adopted by a local authority for dealing with its staff. As I pointed out, the general Government policy of refusing to pay direct Exchequer grants in respect of any bonus to an officer in receipt of a salary over the Civil Service limit has been maintained.

"Turning now to the present claim of the Committee, perhaps I may put the position as follows. We had an award in 1937 of 9s. per insured person. Your Committee found this award unsatisfactory, but none the less it was and remains an award made by a competent tribunal after a long and searching inquiry. The war came with all its consequences to everybody. Practice expenses increased We have met these expenses and we have met any reasonable claim in respect of the new class brought into insurance. I believe we are agreed on that. What is left? You say the award was all wrong—that is, that the whole basis of the tribunal's consideration was wrong We do not and cannot admit that, but the Minister has promised a fresh basic inquiry as soon as conditions permit such an inquiry to be made. You agree, I understand, that the precise material for such an inquiry is not presently available. That way of solving this recurrent problem is barred. The 'service facts' which both of us would wish to present to an arbitrator on any question of 'basis' are unobtainable at the moment. Records have gone overboard and we are left with generalities Moreover, this absence of material on which to base a judgment does not merely negative the idea of an arbitration. In the absence of an arbitration the Minister in this matter is bound to hold the scales fairly between the profession and the body of contributors, employers, employees, and taxpayers who foot the bill, and he, no less than an arbitrator, must be satisfied that a case for an alteration of the fee has been fairly made out

"On the question of bonus I do not think it is in dispute that the Civil Service bonus is limited to those earning under £500 and that it is on a diminishing scale and is not, as in the last war, on a percentage basis.

"We should be the last to deny that insurance practitioners—and indeed the medical profession as a whole—are hard worked, chiefly, no doubt, owing to the demands of the fighting Services, but for a number of subsidiary reasons connected with war conditions But this is true of many other classes of the community, and the Minister and the Secretary of State for Scotland, whom he has consulted, feel it impossible to accept this as a ground for again reopening the award and going beyond the additional 9d. granted in 1941, which seems to them a fair return for the measurable additional practice costs occasioned by the war, and a recognition of the effect of the recent legislation.

"One further point occurs to me. We must not lose sight of the fact that large questions affecting the future of the medical profession are now emerging. The report of the Medical Planning Commission set up by your Association, when finally settled, and no doubt the report to be made by Sir William Beveridge, will bring these issues still more into the forefront; and the matters for discussion will doubtless cover the question of the remuneration of the profession in relation both to general and to hospital practice.

"I do not mention this consideration in any way as suggesting a departure from the promise already given of a fresh basic inquiry when conditions permit, but rather as an indication that circumstances may compel us all to consider a new method of approach. This, apart from anything said above, seems to suggest that in any case the moment is not opportune for raising the present issue now."

6. Being convinced that the Ministry's advisers had failed to appreciate the full effect of wartime conditions on insurance medical practice, an interview was sought and has taken place with Mr. Ernest Brown, the Minister of Health. The Minister has promised to give careful and sympathetic consideration to the views expressed to him, and as soon as his reply is received the Committee will submit to Panel Committees its views on the reply, and the course which the Annual Conference will be recommended to follow.

Consultation between the Government and Profession

7. Arising from the failure of the Government to consult the medical profession before announcing new legislation to introduce a new group into National Health Insurance, it was decided that a satisfactory assurance should be sought from the Minister of Health on the principle involved. The following expression of the Committee's views was conveyed to the Minister of Health:

"1. The action of the Minister of Health in announcing the Government's decision to increase the N.H.I. income limit, after consultation with other bodies but without prior consultation with the body representative of insurance practitioners, has been bitterly resented by panel committees and insurance practitioners throughout the country.

"2. The Committee seeks from the Minister a specific assurance that he will return to the precedent established in 1916 and consult the Insurance Acts Committee before any change in the N.H.I. Acts or the Regulations thereunder is introduced into Parliament"—

to which the following reply was received:

"The Minister has noted the two resolutions set out in your letter of February 19 and is prepared to give the assurance asked for in so far as any proposed changes in the National Health Insurance Acts or Regulations thereunder affect insurance medical practitioners. As you are no doubt aware, such changes are proposed from time to time which in no way affect medical practice."

Organization of Insurance Practitioners

8. The Committee is engaged in examining the machinery for the organization of insurance practitioners, and has appointed a special subcommittee with instructions to pay particular attention to the machinery for co-ordination between insurance practitioners and the Committee. The investigation will include a re-examination of the scheme for collective bargaining which has been in existence since 1917. Similar action is being taken in Scotland.

Group Organization

9. Great importance is attached to the formation of Group Standing Committees. Some Groups have had Standing Committees for many years, and have found them a helpful means of exchange of views between neighbouring Panel Committees. A Group Standing Committee gives the direct representative of the Group on the Insurance Acts Committee an opportunity of meeting representatives of his constituent committees and hearing their views on current matters of interest to insurance practitioners. The Insurance Acts Committee urges the Panel Committees in any Group in which a Group Standing Committee is not functioning to take immediate steps to form such a committee.

Propaganda

10. Panel Committees are aware of the Committee's association with the comprehensive scheme of propaganda undertaken by the B.M.A., which was gathering momentum when war was declared and which had for one of its principal objects the enlightenment of the public on the work being done by insurance practitioners. The scheme was terminated for various reasons associated with the war, and while a revival of propaganda on a large scale is impracticable until war ceases, the Committee is exploring the possibility of an early resumption of publicity on a modified scale.

Medical Planning Commission

11. The Interim Report of the Medical Planning Commission was referred to Local Medical and Panel Committees for their consideration and observations as an initial step towards the presentation to the Commission of the views of insurance practitioners generally. The Insurance Acts Committee has considered carefully the observations of the 64 Panel Committees which have replied. The recommendations to the Conference set out below represent substantially the majority views of these Committees, and with these views the Insurance Acts Committee is in agreement.

Recommendation B.—That the Conference accepts the broad definition of the objects of medical service:

(*a*) To provide a system of medical service directed towards the achievement of positive health, the prevention of disease, and the relief of sickness; and

(*b*) To render available to every individual all necessary medical services, both general and specialist, and both domiciliary and institutional.

Recommendation C.—That free choice of doctor and patient should be an essential feature of any future service.

Recommendation D.—That the Conference is of opinion that group practice in some form is deserving of favourable consideration by the Medical Planning Commission.

Recommendation E. — That provision should be made by the Government only for persons compulsorily insured under the N.H.I. Acts, the dependants of such persons, and others of a like economic status.

12. The Committee is opposed to the establishment of a whole-time salaried

Government medical service, but at the same time it feels that something more than the mere extension of National Health Insurance to the dependants of wage-earners and others of like economic status, coupled with the enlargement of its scope by the inclusion of consultant and specialist services, should form the basis of the co-ordination and integration of health services of the future. The Committee has considered the plan in broad outline set out in the Medical Planning Commission's report and submits the following recommendations thereon:

Recommendation F.—That the Conference approves the general principle of the establishment of health centres.

Recommendation G.—That the Conference considers that all registered medical practitioners should have the right to take part in the service and, so far as possible, a choice of the area in which they will serve.

Recommendation H.—That the Conference is not in possession of sufficient information to enable it to express an opinion on the method of remunerating general practitioners for their services under the Commission's plan, and that the Medical Planning Commission be requested to give it further consideration.

Recommendation I.—That the Conference considers that the question of the method of remunerating consultants is a matter for the consultants to arrange.

Recommendation J.—That, subject to the foregoing decisions, the Conference is in favour of the co-ordination and integration of health services on the basis of the plan set out in broad outline in the draft interim report of the Medical Planning Commission.

Recommendation K.—That in view of the fact that the full adoption of the plan may be delayed for various reasons, the Conference considers that some interim changes should be made.

Recommendation L.—That the Conference is in favour of the proposals for immediate post-war application—namely: (1) the two-way extension of National Health Insurance to include (*a*) the dependants of wage-earners and others of like economic status within the current N.H.I. income limits, and (*b*) the provision of consultant and specialist services; (2) the establishment of experimental co-operative practice in some areas; (3) the creation of Regional Hospitals Councils with executive or advisory functions.

Limitation of Doctors' Lists

13. The Special Conference in July, 1941, expressed the view that in the event of the new class of entrants into insurance bringing the number on a doctor's list above the number allowed, such new entrants should not be taken into consideration in deciding whether the maximum had been reached. The Ministry of Health has issued an instruction to insurance committees which gives effect to the Conference's view.

Central Mileage Fund

14. The Central Mileage Fund is being increased by an amount which will take account of the entry into insurance of the new group of non-manual workers. The Ministry's first statement indicated that the increase would affect only the ordinary portion of the Fund, no mention being made of the reserved and special expenses portions. Eventually, however, the Ministry agreed to apply the increase to the entire Fund.

Dependants of Service Men

15. Despite repeated representations by the Association, the Government has persistently declined to provide medical benefit for the dependants of men in the armed Forces. It is the view of the Service Departments that the pay and allowances of serving men and their families are sufficient to provide medical treatment for dependants without Government assistance. The matter is being pressed upon the Government again.

Medical Records of Ex-Service Men

16. The Committee has noted for discussion with the Ministry of Health the present unsatisfactory position in regard to the availability of medical records of men discharged from the armed Forces on medical grounds.

Medical Benefit for War Workers in Hostels

17. In consultation with representatives of Panel Committees in the areas concerned, a plan was worked out for the provision of medical benefit for war workers in hostels situated in districts where the normal arrangements would be impracticable because of the distance between the hostel and the nearest doctors. The arrangements have included the appointment of a local doctor as a hostel medical adviser, with supervision of the sick-bay as a principal duty.

Election of Panel Committees

18. The Ministry of Health and Department of Health for Scotland were asked to make provision for the resumption of the election of the Panel Committee in any area in which an election was desired by the Panel Committee, and gave an undertaking that sympathetic consideration would be given to any such application by a Panel Committee.

Medical Benefit for Juveniles

19. The Committee has raised with the Ministry of Health the position of juveniles who, while still at school, are employed during the school holidays and thus become insured as juvenile contributors and remain entitled to medical benefit until they are 16½ years of age (if still at school) or until they become adult insured persons at 16. The Ministry states that legislation would be required to exclude them from insurance, and there are certain difficulties which preclude the possibility of introducing such legislation. It is stated that the liability of an employer to pay contributions in respect of an employee must necessarily be capable of being determined week by week during the course of the employment, and that it would be extremely difficult, if not impossible, to determine with precision whether a juvenile would in fact leave the labour market and return to school at the end of the holiday period. The position in regard to payments into the Central Practitioners Fund for these juveniles is somewhat obscure, and the Committee is seeking further information.

National War Formulary

20. The *National War Formulary*, compiled by a special committee (including representatives of the Insurance Acts Committee) appointed by the Minister of Health, came into operation for National Health Insurance purposes on December 1, 1941. Insurance practitioners are asked to use this new *Formulary* and to refrain from using the peacetime *National Formulary*.

Medical Benefit for Seamen

21. A seaman on coastal service sometimes experiences difficulty when he requires treatment at a port of call because it has been necessary for him to leave his medical card with a doctor when obtaining treatment at a previous port of call. It has been suggested to the Ministry of Health that the difficulty would be overcome by the issue of "travellers' vouchers."

Application for Medical Card

22. It was suggested to the Ministry of Health that it would be helpful to the clerk to an insurance committee in identifying an application for a medical card if the form of application (Form Med 50) contained a space for the name of the employer. Ultimately it was agreed that the Committee's object would be secured by extending Note 1 at the foot of the form by the addition of the words: "Otherwise enclose your current contribution card or a certificate of employment from your employer or other evidence of insurable employment when sending this application to the insurance committee."

Pension and Insurance Scheme

23. In 1932 the Insurance Acts Committee negotiated with three insurance companies the "Pension and Insurance Scheme for Insurance Practitioners." The agreement with the companies, which was for a period of 10 years expiring on December 8, 1942, did not exclude war risks. Directly after the outbreak of war the companies pressed for the insertion of a war clause in the policies providing that in the event of the death of the assured being due directly or indirectly to enemy action the amount payable would be limited to a sum representing the surrender option of the policy. The companies' proposal was resisted, and after prolonged negotiations agreement was reached on the special conditions to be included in the new policies. The conditions provide that all practitioners who are killed by enemy action while serving in H.M. Forces, excluding members of the Home Guard as at present constituted, shall be excluded from the full benefits of the scheme: and that all other practitioners (including members of the Home Guard) who are killed by enemy action in the United Kingdom shall be covered by the full benefits of the scheme. The Committee again draws attention to the attractive nature of this scheme and the exceptional terms available only until the present agreement expires on December 8, 1942.

National Insurance Defence Trust

24. The Balance Sheet and Statement of Expenditure and Income of the Trust for the year ending December 31, 1941, is being sent to every Panel Committee.

25. Two of the five practitioners receiving financial assistance from the Trust under the terms of Minute 30 of the 1938 Annual Conference have died. The Trustees decided, as from January 1, 1942, to increase by £40 per annum the existing grant of £200 per annum to each of the remaining three annuitants, to meet increased costs due to wartime conditions.

SCOTLAND

This particular section deals with matters which are of a purely domestic Scottish nature and which have not been referred to in the preceding paragraphs, or upon which action in England and Wales differs from that taken in Scotland

Chairman and Deputy Chairman

26. Dr. J. F. Lambie (Glasgow) and Dr. A. F. Wilkie Millar (Edinburgh) were reappointed Chairman and Deputy Chairman for the session 1941-2.

Meetings of the Subcommittee

27. Three meetings of the Subcommittee and one meeting of the Rural Practitioners' Subcommittee have been held.

Scottish Representation on I.A.C.

28. It has been agreed that direct representation of Scotland on the parent Committee shall be on a territorial basis, and that Scotland as a whole shall have 4 direct representatives instead of 3. Scotland has been divided into 4 subgroups: (1) South-East Scotland (including Fife, Clackmannan, and Kinross); (2) North of the Tay; (3) City of Glasgow; (4) South-West Scotland.

Scottish Mileage Fund

29. Agreement with the Department of Health for Scotland has been reached on an increase in the Fund from £44,675 to £49,366, plus an additional sum in respect of the new group of non-manual workers. The latter increase is provisionally assessed at 2%.

Temporary Residents from Clydebank

30. A satisfactory settlement has been reached in regard to the abnormal temporary resident payments for Clydebank insured persons following the severe air raids in that area in 1941.

Services for War Workers

31. Following the receipt of reports of the value of the experimental scheme in the area of the Clyde basin, which affords facilities for the early diagnosis and treatment of illness or unfitness occurring in war workers, doctors are being advised to ensure that their patients receive the full benefits of the scheme.

PROCEEDINGS OF COUNCIL

The first meeting of the new Council of the British Medical Association was held at the conclusion of the Annual Representative Meeting on Sept. 10. Dr. Peter Macdonald proposed the re-election of Mr. H. S. Souttar to the chair for one year, and this was seconded by Mr. McAdam Eccles and carried unanimously and with acclamation. The Chairman thanked the members for their confidence and referred to the large amount of quiet work in the background which had been taking place during the past three years. He also welcomed to the Council the new members, of whom there were an unusual number.

The Council proceeded to the election of committees. The Secretary announced that conversations had taken place with the British Council concerning the allocation of a certain part of the Association's premises for the use of medical members of the Allied Forces at present in this country. A proposal has been made that the Garden Court Wing, not yet completed, should be used for this purpose. The Office Committee had considered this proposal and had made an offer to the British Council that if they could obtain authority for the wing to be completed its use would be given, free of charge, for the purpose requested. The premises were in a convenient situation, they were attached to the House of the Association, and the visitors would have the facilities of the Association library and possibly the lounge. Before the plans came to fruition a meeting of the medical heads of the Allied Forces would take place in order that their wishes might be considered. It was a gesture which the Association would like to make. The Treasurer expressed his agreement with the proposal, though he thought the ultimate cost would be about £5,000. The proposal was cordially approved by the Council.

Other routine business was transacted.

PROPOSED NORTH BEDFORDSHIRE AND SOUTH BEDFORDSHIRE DIVISIONS

Notice is hereby given by the Council of the Association to all concerned of the following proposal made by the Council of the Bedfordshire Branch, that the area of the Branch be divided into two Divisions to be known respectively as the North Bedfordshire and South Bedfordshire Divisions, with areas as follows:

North Bedfordshire: Municipal Borough of Bedford; Urban Districts of Ampthill, Biggleswade, Kempston, and Sandy; Rural Districts of Ampthill, Bedford, and Biggleswade.

South Bedfordshire: Municipal Boroughs of Dunstable and Luton; Urban District of Leighton Buzzard; Rural District of Luton.

Any member affected by the proposal and objecting thereto is requested to write to me by October 31, 1942, stating the objection and the ground therefor.

G. C. Anderson,
Secretary.

Sept 24, 1942.

Branch and Division Meetings to be Held

Shropshire and Mid-Wales Branch —At Royal Salop Infirmary, Tues., Oct. 6, 3 30 p m. Annual general meeting All medical practitioners in area of Branch are invited to attend.

All "R" practitioners in "A" posts at Oct 1 who have held those posts for 3 months or longer are to be recruited immediately, but no hospital is to be asked to give up more than 50% of its holders of such posts. This decision, which follows a recommendation of the Medical Personnel (Priority) Committee, has been conveyed to hospitals by the Ministry of Health in Circular 2692. Preliminary recruitment notices are being sent by the Central Medical War Committee to all doctors affected who have not been rejected by the R.A.M.C., but if the number receiving notices at any one hospital exceeds 50% of the total "A" posts occupied then the hospital should notify the Central Medical War Committee at once of those doctors it wishes to retain. In view of the urgent Service demands holders of "A" posts may not make representations to the Central Medical War Committee, although they retain their right of appeal on grounds of hardship or conscience. The circular also states that the committee will not be able to consider any increases in establishment or any up-grading within an establishment until further notice. "R" practitioners not affected by these latest arrangements will continue to be recruited at the end of 6 months in their present posts as set out in Circular 2660.

H.M. Forces Appointments

ARMY

The following Consultants, Temp Cols (local Brigs.), have been granted the local rank of Major-Gen.: A. W. Stott and C. M Page, D S.O

Col. E. B Allnutt, M C, late R.A M.C, having attained the age for retirement, is retained on the Active List supernumerary to the establishment.

Lieut-Col. (Temp. Col)- F. G. Flood, M C, from R.A.M.C., to be Col.

Lieut.-Col T J Mitchell, D S O, R A.M C, retired pay, is granted the rank of Col on ceasing to be employed.

ROYAL ARMY MEDICAL CORPS

Major T E. B Beatty to be Lieut -Col

TERRITORIAL ARMY

Royal Army Medical Corps

War Subs Capt. M. K Mellett has relinquished his commission on account of ill-health, and is granted the rank of Capt

POSTGRADUATE NEWS

A course of lectures, open to all medical practitioners without fee, begins to-day (Friday, Oct. 2), at 4 p m, at the Royal National Throat, Nose and Ear Hospital, Gray's Inn Road, W C, when Mr. G H Howells speaks on "Ethmoiditis" The course will be continued at the same time on Oct 16 and 30, Nov 13 and 27, Dec. 11, Jan 8 and 22, Feb 5 and 19, and March 5 and 19 - Details will appear in the postgraduate diary column of the *Supplement* of the appropriate weeks.

WEEKLY POSTGRADUATE DIARY

British Postgraduate Medical School, Ducane Road, W —*Daily,* 10 a m to 4 p m, Medical Clinics, Surgical Clinics and Operations, Obstetrics and Gynaecological Clinics and Operations *Daily,* 1 30 p m, Post-mortems. *Mon*, Course on Surgical Care of the Soldier in Training begins *Tues.,* 10 a m, Paediatric Clinic; 11 a m, Gynaecological Clinic. *Wed*, 11 30 a.m, Medical Conference; 2 p.m., Carbohydrate Metabolism and Diabetes *Thurs*, 2 p m, Dermatological Clinics *Fri.* 12 15 p m, Surgical Conference; 2 p m, Gynaecological Conference; 2 p m, Sterility Clinic

Fellowship of Medicine, 1, Wimpole Street, W — *Royal Cancer Hospital* 3 p.m. and 4 30 p m, Anaesthetic course Lectures, practical demonstrations at various London Hospitals. *London Homoeopathic Hospital:* Wed, Final F.R.C S. Clinical Surgery Instruction. *Wimpole Street, W.* · Mon and Thurs 8 p m, The Theory of Physiology Lectures suitable for F R C.S, M R.C.P., and D A. candidates *National Hospital for Diseases of the Heart*. Tues and Wed., 10 a m Out-patient clinics

London School of Dermatology, 5, Lisle Street, W C —*Tues* 4 30 p m Dr R T Brain. Ringworm Infections. *Thurs*, 4.30 p m. Dr J. E M Wigley: General Principles of Treatment

DIARY OF SOCIETIES & LECTURES

Royal College of Surgeons of England, Lincoln's Inn Fields, W C —*Thurs.*, 3 30 p.m Dr R J Ludford. Malignant Growth in Tissue Cultures

Chadwick Trust —At 26, Portland Place, W, *Tues*, 2 30 p m Sir Leonard Hill, F R S · The Interrelation of Clothing and Shortage of Fuel in Matters of Health

Socialist Medical Association.—At Conway Hall, Red Lion Square, W C, *Wed*, 5 30 p m Prof J. A. Ryle · Social Medicine

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s 6d This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue

BIRTHS

Morse —On Sept 19, 1942, at Pendean Nursing Home, Midhurst, to Hilda (*née* Morgan), wife of Dr. Philip W Morse, M R C P., a son.

Reid —On Sept 23, 1942, at the Seabourne Nursing Home, Bournemouth, to Joan (*née* Jefferson), wife of R. Hall Reid, Esq., M B, Ch.B, a daughter (stillborn)

MARRIAGE

Hyde—Cox.—On Sept. 18, 1942, at Milverton, Somerset, Ernest William Hyde, M B., B Chir., M.R.C.S, L R.C P., to Vera May Cox.

DEATH

McCully —On Sept. 17, 1942, at 51, New North Road, Huddersfield, Andrew Lowry McCully, M B., Ch.B.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY OCTOBER 10 1942

ANNUAL REPRESENTATIVE MEETING

Wednesday, Sept. 9 (*continued*)

REPORT OF MEDICAL PLANNING COMMISSION

Following upon the debate in which the Representative Body approved in broad outline the proposals relating to health centres in the draft report of the Medical Planning Commission, several other matters which came under Question 6 were briefly discussed. A motion by Fife that the proposals for the unification of hospitals under a regional body be approved, providing unification was confined to general hospitals and that special hospitals were excluded, was opposed by several members. Mr. H. J. McCurrich (Brighton) said that to leave the special hospitals in splendid isolation was against the whole tendency of the measures already approved. Dr. F. M. Bodman (Bristol) said that such a proviso would undo work already done. In his area a divisional council had been set up on which all hospitals, general and special, were represented. The Fife motion was rejected.

Appointment and Pay of G.P.s

Dr. W. Yeoman (Harrogate) moved non-approval of the proposals in the report relating to the appointment of practitioners to a national service. The proposals seemed to envisage some central body which would allocate practitioners, so that all freedom of choice as to where he would live and work would be lost to the individual. This amendment was withdrawn in favour of a different form of words moved by Dr. O. C. Carter (Bournemouth): "That all registered medical practitioners should have the right to take part in the service, and as far as possible should have the choice of area in which they would serve," and this was carried.

Dr. J. C. Arthur (Gateshead) moved disapproval of the proposals relating to remuneration of general practitioners. His constituents felt that payment should be on a *per caput* basis pure and simple. The proposal favoured the lazy doctor. At the same time he agreed that in some areas, such as the western islands of Scotland, the capitation basis would not be a fair one. Dr. S. Wand (Birmingham) said that the practitioner would be required to attend at the centre quite apart from whether he had anyone on his list or not. Certain local health authority work to be done by the practitioners at the centre was also in view. Dr. A. T. Rogers (Bromley) said that a purely capitation basis of payment would be grossly unfair to doctors in scattered rural areas, though the basic salary, he thought, should vary considerably throughout the country. The Gateshead amendment was altered to read " . . . be referred back to the Commission," instead of " be not approved," and in this form it was carried.

Dr. J. A. Pridham (Dorset) moved that agreement to any scheme for the regulation of medical practice should be subject to equitable pay being obtained and also to an adequate and agreed compensation being given for the capital value of practices. He hoped that some such resolution as this would be put up every time until a satisfactory scheme came into existence. Prof. Picken suggested that this condition would apply to the whole scheme and was more properly covered by a later motion by Cardiff that any resolutions agreed to were subject to the conditions of service and system of management being satisfactory to the profession. The Dorset motion was carried.

Remuneration of Consultants

Dr. Arthur moved non-approval of the proposals relating to the remuneration of consultants—namely, that consultants should work on a salaried basis. Senior consultants, at any rate, should be in a position to undertake private work on the basis of payment for services. The Chairman said that the proposals in the report were arrived at by a committee consisting almost entirely of consultants. Mr. McCurrich said that consulting services would be very difficult to work entirely on a capitation basis. A basic salary was thought to be an advantage; the more senior members should be allowed to do private consulting practice. Dr. E. Bertram Smith (Notts) said that in discussions in his area the inclusion of a part-time consulting and specialist service had been recommended, with payment for the domiciliary part of the service on an itemized basis. Dr. C. W. Somerville (Lothians) said that in the country consultants spent a long time and saw few patients. A man might have to travel from 10 to 50 miles to see one patient. A salary basis was therefore the more acceptable. Mr. Mark Fraser (Cumberland) said that it was generally agreed by the consultants in his area that a salary basis for the younger consultants should be allowed if the best type of man was to be obtained. Dr. H. E. Offord (Reigate) said that a part-time salaried basis, such as many of them had been working on in the E.M.S. during the last two years, was preferable. The Chairman thought it a little early in the development of medical services to lay down hard-and-fast lines.

It was agreed that the proposals relating to payment of consultants be referred back to the Commission.

An amendment that complete indemnification of every general practitioner for the loss of his practice should be arranged was moved by Dr. D. J. Wilkie (Lancaster), who said that doctors in his area felt that any loss of capital which had been sunk in their practice should be completely repaid to them and made available immediately. Indemnification was more useful on many occasions than the prospect of a pension either for oneself or one's dependants. The amendment was carried, as was another by Aberdeen, that in the plan as set out in the report adequate financial provision should be made for research, and one by West Suffolk, that dental and ancillary services should be included in the plan.

Character of Central Administration

The Chairman said that it would be useful to have a brief debate on the character of the central administration of the proposed services, whether it should be a Government Department or a corporate body, but he anticipated that at the end the meeting would refer back this part of the report to the Commission for further elaboration.

Dr. J. H. Stephen (Aberdeen) moved: "That the central machinery of the medical service should be a Government Department." The introduction of a corporation would be difficult and seemed to entail something like a totalitarian system. Dr. C. I. Schiff (City of London) said it was easy to see how, in the belief that democratic procedure was inadequate to cope with the problems involved, corporations might be set up to deal with matters medical, with matters legal, and indeed with various sides of professional and social life. Certain problems would be common to all these corporations, which would interlink to form central bodies, and in a comparatively short time the authority of Parliament would be superseded. The method of government by corporate bodies was alien to the tradition of this country, undemocratic, and based on a weak-kneed imitation of Italian models. Dr. D. F. Whitaker (Guildford) could see no reason why a corporate body should be undemocratic. The medical profession was registered by a corporate body, formed by the appointment of suitable members. The work of co-ordinating the health of the nation was a matter primarily for medical people, although, as some of the money must come from public sources, the Government must be represented. Dr. H. S. Pasmore (Kensington) said that his Division considered a Government Department the method of choice, assisted by a central medical services board with executive functions and having adequate medical representation The work done by various corporate bodies such as the B.B.C. and the L.P.T.B. was recognized, but such a body would not be ideal for the administration of medical services for three reasons: (1) the approved societies would be entitled to full representation on the controlling board; (2) the powers of such a board would be strictly limited by charter owing to the monopolistic rights granted to it, and a new charter would be needed for any developments outside the scope of the original, a necessity which might hinder the development of medical services, particularly into the fields of education and housing; (3) the public would be unable to exert any large influence on the corporation's decisions.

Dr. F. E. Gould (Birmingham) said that his Division, while not quite clear what it wanted, knew that it did not want the Ministry of Health as at present constituted. Dr. R. W. Rae (North Staffs) said that the point of importance was not a corporate body versus some other form, but to ensure adequate medical representation in the control. Dr. R. W. McConnel (Bucks) suggested that control should be centred in a National Board of Health consisting of laymen appointed by Parliament or the Privy Council and elected members who would be chairmen of consultative councils consisting of members of the medical profession elected by their fellows for a term of years.

Dr. Alan Wigfield (East Herts) said that his Division would welcome the establishment of a central board with executive functions, to which should be transferred the health functions now discharged by all Government Departments. The board should be indirectly elected—i.e., by nomination of the Prime Minister—it should not be large, and its members should be appointed for a term of years. All policy on medical matters must be long-term and pursued despite changes of Government. But to formulate policy was not enough, there must be driving force; therefore a purely advisory body might, through lack of responsibility for action, become negative and cynical through frustration. The body must be better informed than any politically elected body could be. Its members should be men of the first quality; membership should be a comparatively rare distinction and therefore likely to attract the best people. A substantial proportion of the members should be medical men; this would follow from an unrestricted choice of the most suitable persons, and therefore his Division did not think it desirable to press for a statutory proportion of medical members. Dr. F. M. Grant (South Shields) said that the Ministry of Health had not been conspicuously successful in administering national health insurance, at least from the point of view of the medical profession, and to continue to work an even larger scheme under the same authority seemed to him folly.

The motion that the central machinery of the medical service should be a Government Department was rejected by a majority of about three or four to one, and a further motion by Aldershot that the machinery should take the form of a corporate body was carried in about the same proportion. After some discussion as to procedure the following further motion was carried:

> That this meeting, having strongly expressed its preference for the administration to be carried out by a corporate body, refers the matter for further consideration to the Commission.

On the question of local machinery a motion that the local machinery should take the form of regional councils was met by an amendment by Tunbridge Wells, which was carried, as follows:

> That whatever body is set up to deal with decentralized health administration should be required by statute to delegate the administration of hospitals and other medical, health, and ancillary services to a committee or committees, such committees to be composed of (1) non-medical members of knowledge and experience in health matters and nominated on a non-party political basis, and (2) medical men in adequate numbers, such medical men to be elected by and from the medical men in the area.

It was also agreed that the medical advisory machinery should contain adequate general practitioner representation, and that any medical scheme should be divorced from the control of the approved societies.

Interim Changes

The meeting then turned to discuss possible interim changes which might be made in view of the likelihood that the adoption of the entire plan would be delayed. Dr. Wilkie moved that no changes be made until a complete scheme could be introduced. Changed conditions might force changes upon them, but it should be made clear that these must be part of and in accordance with the general plan; any which did not harmonize completely with the plan should be resisted, and if they were required to submit to them they should do so only under protest, with a clear intimation that when conditions changed they would scrap them without hesitation if they hampered the services they wanted to undertake. Mr. McCurrich also held that the whole scheme should be approved before any part of it could be brought into operation, though he did not want to see purely experimental schemes excluded.

Dr. E. C. Dawson (Derby) said that the meeting would be defeating its own objects by passing such a motion. They had already agreed that medical administration should proceed by evolution. It would be a pity if they were bound not to take any step forward in the right direction until the complete scheme was available. Dr. Farquharson (Bucks) thought that experimental co-operative practice might be accepted in some areas immediately. It would afford an excellent protection to absent members. By amalgamation of practices their interests would be preserved in a much better way than under the Protection of Practices Scheme. Dr. J. B. Miller said that all that the meeting was being asked now to approve in the form of immediate proposals was the "General Medical Service Scheme for the Nation" which the Association had reaffirmed in 1938. This proposed the extension of medical benefit to insured persons' dependants and others of like economic status and the enlargement of the scope of the service to include consultant and specialist provision.

Prof. R. M. F. Picken moved as an amendment:

> That before it is possible to bring the complete plan into operation some interim changes may have to be made, but these should be so designed as to fit into the plan as now evolving

He said that it might be essential, if the war went on long enough, to carry out some rather serious reorganization of all forms of medical practice before the end of hostilities, and his amendment would enable the Association in emergency to deal with the situation if it did arise. The amendment was carried.

Two-way Extension of National Health Insurance

The Chairman moved formally: "That proposals for immediate post-war application should include the two-way extension of National Health Insurance—namely, to include dependants and others of like economic status (within the current N.H.I. income limits) and the provision of consultant and specialist services." To this there was an amendment by Cleveland to substitute for the reference to current income limits the words "within the income limit of £250 per annum." The Chairman, after replying to questions, said he had discovered that the income limit of £250 was definitely mentioned in the "General Medical Service for the Nation," which was Association policy, and therefore he allowed Cleveland to move the amendment. Eventually it was agreed to proceed to the next business, which meant, said the Chairman, that the policy of the Association remained just where it was.

Experimental Co-operative Practice

The next motion, in the name of 22 Divisions, was that the proposals for immediate post-war application should include the establishment of experimental co-operative practice in some areas. Dr W. A. Kirkpatrick (Cleveland) was anxious that the word "voluntary" should be inserted here. The Chairman said that the Commission had voluntary arrangements in mind in framing the question.

Dr. R. Prosper Liston (Tunbridge Wells) moved as an amendment:

> That the establishment of experimental co-operative practice in some areas should be attempted, with certain financial safeguards, for those willing to make the experiment. Such safeguards should cover two eventualities: (1) if any drop in income occurs as a result of the experiment, and (2) if co-operative practice becomes a national feature, then any loss of income or initial expenses should be reimbursed by the body asking the doctors to undertake this experiment.

Dr. J. A. Brown (Birmingham) said that in a proposal which was taking effect in his city for experimental co-operative practice, both the safeguards mentioned had been taken into account. The Tunbridge Wells amendment was carried.

The last of the questions set out in Section V was answered by the passing of a resolution, without discussion, that the proposals for immediate post-war application should include the creation of regional hospital councils with executive or advisory functions. The Chairman said that the Commission thought it too early to say whether the functions should be the one or the other, and he hoped the meeting would not insist on a decision on that point.

Thursday, Sept. 10

The Chairman (Dr. Dain) said that there remained a large number of other motions sent in by Divisions and relating to various matters which it was desired to bring to the Commission's attention.

Health Legislation

Sir Kaye Le Fleming (Bournemouth), before moving the first of these, said how much they all appreciated the labours of the Commission. He spoke as one who knew what such labours meant. He also commented on the excellent draughtsmanship of the report. The Association should be proud of having a staff which, while heavily overworked in other ways, was capable of producing such a document. (Applause.) He then went on to ask the meeting to express the opinion that further consideration and criticism should be given to the machinery for introducing health legislation, a matter not mentioned in the report. The health legislation contemplated in these proposals would be introduced by the Minister of Health, and a new Minister of Health made his appearance, on the average, every eighteen months or two years. He came into office knowing nothing whatever about health matters; his appointment was made largely on political grounds. Politics and medicine did not go very well together. If the Minister was ambitious to introduce health legislation he must take advice, probably that of the Chief Medical Officer of the Ministry. The Ministry was a very useful but overworked body, largely concerned with administrative and preventive medicine and entirely out of touch with medicine on its practising side. Legislation then had to pass through the House of Commons, which had never shown any great fondness for the medical profession. There were medical M.P.s, but, in the nature of things, they represented constituencies, not the members of their profession. The whole machine for health legislation was cumbersome and ill adapted for its purpose.

The CHAIRMAN OF COUNCIL (Mr. Souttar) said that those who had any knowledge or experience of health legislation must agree with what Sir Kaye Le Fleming had said. The improvement of the position would be most carefully considered by the Commission when it came to the point at which they wanted to get something done; up to now they had been considering what the views of the medical profession should be. He believed that the present Minister of Health (Mr. Ernest Brown) took a great personal interest in the future development of medical practice, apart altogether from the political aspect, and he had reason to suppose that he was likely to appoint a really important and experienced body of medical men to advise him on what should be done with the future report of the Commission. Dr. J. B. MILLER said that the same applied to the Secretary of State for Scotland (Mr. T. Johnston), who was responsible for health affairs north of the Tweed. He was carrying through by his own forceful personality a scheme for the early detection of pulmonary tuberculosis among munition workers aged 15 to 25 in the West of Scotland. He would not say that Mr. Johnston was more sympathetic towards the medical profession than other Ministers, but he certainly had a knowledge of health affairs. The speaker also drew attention to paras. 52 and 53 of the interim report, in which the suggestion was made that whatever the form of central administration a central medical advisory committee should be appointed on a statutory basis. Dr. W. S. MACDONALD (Leeds) said that the problem the profession had to face was unity in itself. which unity was of great bargaining power when dealing with the Government.

The meeting adopted the motion asking the Commission to give further consideration and criticism to the machinery for introducing health legislation.

Consultation with the Profession

The CHAIRMAN said that a number of motions under this heading were put forward under a misapprehension. The report now before the Representative Body was not one under which any action or change could take place; it was an interim one which, having been considered, would now be the subject of further consideration by the Commission. His personal view was that this was not the time to say when the changes should or should not take place; at the moment no changes were agreed. In reply to a representative he said that he could give complete assurance that the opportunity would be given for considering more complete proposals.

The CHAIRMAN OF COUNCIL said that the Commission had no authority to bring about any changes. Its job was to set out an ordered account of what it thought might be accepted by the various sections of the profession. The findings of the Representative Body and of other bodies connected with the Commission would be considered at the next meeting. The Commission would then take a long time to formulate what he hoped would be a fairly complete report, which would again be placed before the Representative Body. The whole object of this procedure was that the medical profession should be enabled to make up its mind as to what it wanted. When that was done the Minister would probably ask for the appointment of a Royal Commission to investigate the whole matter. Many others besides medical men were concerned; indeed, the entire public. There need be no fear that anything would be done without full consultation.

Two representatives complained that extracts of the report were published in the lay press on June 19 before members had received the *Journal* dated June 20 in which the report appeared. The CHAIRMAN explained the circumstances in which the *Journal* was available for quotation by the lay press immediately on its publication. This country had a free Press, which the Association invited to its meetings, leaving to the judgment of the journalists the selection of matters of interest to their readers.

Conditions of Service

Motions by Cardiff insisting that the conditions of service should be the same for men and women, with equal opportunity of promotion or of gaining experience (which the Chairman said was already the policy of the Association), and that any resolutions agreed to were subject to the conditions of service and system of management being satisfactory to the profession, were carried, as was also a motion by West Suffolk, that provision should be made in the scheme to secure that the control of practices by outside financial interests was impossible.

Dr. E. H. RICHARDS (N. Staffordshire) had a long motion calling for the preservation of freedom in clinical medicine, resistance to restriction by financial interest and lay control, and the holding of executive posts in the Ministry of Health by medical practitioners (the present administration of the Ministry by laymen was described as "pernicious"). In the same resolution the friendly societies were declared to have outlived their usefulness, and it was stated that their multiplicity was wasteful and their administration of National Health Insurance funds was extravagant and not uniform. The mover said that his Division considered that the restriction of medical practice by financial interests was the main root cause of the present troubles. The word "pernicious" in regard to the present administration of the Ministry of Health was used deliberately by his Division, and he wondered whether anyone having heard Sir Kaye Le Fleming that morning would quarrel with that word. So far as the approved societies were concerned, figures could be easily given to show that their multiplicity was wasteful. There were 6,000 approved societies throughout the country. Two of them alone (the Prudential and the National Amalgamated) had almost 6 million insured persons as members, but 440 societies had fewer than 1,000 members and 34 had fewer than 100. In Glasgow among the societies functioning in the city 98 had only 1 member each. In a works in the South-West of England there were 337 employees who between them were administered by 36 societies. Was that an ideal state of affairs? The administration of the societies must be extravagant under such conditions. Moreover, the administration was not uniform. A few of the societies supplied all the optional benefits, some of them certain selected benefits, others again provided the benefits in some years and not in others, and certain societies did not provide benefits at all. His Division also urged as a general principle that every medical service should be controlled and administered by a committee or other similar body containing at least a 50% medical membership, and that a new branch of medicine—namely, an administrative branch—should be established.

Sir KAYE LE FLEMING wished to dissociate himself from the use of the word "pernicious" in relation to the present administration of the Ministry of Health. He had nothing but the highest respect for the Ministry and its medical officers. The work they were doing was excellent, and the criticism he had made earlier in regard to health legislation in no way reflected upon the work which the officers of the Ministry of Health were doing. The motion by North Staffordshire seemed to him "a prime collection of what-nots," and how the meeting was going to deal with it passed his imagination. He suggested that the proper course was to proceed to the next business, and this was agreed to.

A motion from Tunbridge Wells, "That those coming within the plan must be eligible for equal benefits, and that whatever financial scheme is evolved must ensure that all moneys are collected and distributed by the State without the intervention of private interests (either on a profit or non-profit basis) in medical or sickness benefit," was carried.

Doctors and Membership of Local Authorities

Dr. H. D. McILROY (Greenwich and Deptford) had a resolution declaring it to be essential that the existing law be amended to permit practitioners to act as members of local authorities while participating in medical services. The CHAIRMAN asked whether it was seriously argued that the medical profession should be given a privilege of this sort which was not extended to other members of the community. At all events such a proposal should be postponed until the later and more concrete report of the Commission was before them. It was moved, and agreed to, that the meeting proceed to the next business.

Hospital Services

Dr. J. A. BROWN (Birmingham) moved:

> That this meeting is in agreement in principle that committees of the senior medical staff should be set up in all hospitals. The medical superintendent, however, should be the chairman of this committee, and the resolutions of the committee shall be trans-

mitted to the Hospital Management Committee through him, otherwise it will be impossible for the medical superintendent to carry out his duties as chief administrative officer. It is also desirable that committees of other members of the hospital staff should be appointed and their resolutions conveyed to the Committee of Management in a similar way if relating to matters that cannot be adjusted by internal administration.

The **Chairman** suggested that this be referred to the Commission for consideration by its Hospitals Committee, and this course was agreed to.

Access of G.P.s to Hospitals

Dr. W. **Arnott** (Oxford) moved:

> That an essential part of any comprehensive scheme of medical organization should be the provision of beds (*a*) for patients who require nursing and medical attendance within the competence of the general practitioner, but do not require specialist investigation or treatment, and (*b*) for normal confinements. The beds under (*a*) and (*b*) should be under the effective charge of the patient's own medical attendant—provision for such beds being made either in a cottage hospital, or in a sick bay related to a health centre, or in a general practitioner hospital, or in a general hospital.

He said that general practitioner beds were an essential part in the development of medical science. They were needed alike for the help and relief of the sick person and the help and relief of the nurses. Many cases of bronchopneumonia were sent into hospital on account of inadequacy of nursing at home. In the same way the maternity hospitals could be greatly relieved by the provision of beds for normal confinements. Finally, the beds would be of great help to the general practitioner in the pursuit of his work.

Dr. **George McFeat** (Lanark) said that health centres were unsuitable for country districts. Cottage hospitals would prove a useful substitute. Country doctors were isolated and unable to co-operate adequately so that their needs and desires received insufficient publicity. Their minority position in the profession and the difficulty of meeting to develop a common policy had prevented a much-needed improvement in the rural medical service. But in spite of their difficulties they maintained for the most part a high standard. They had to carry greater responsibility than their urban colleagues, who had hospital and consultant facilities at hand, and therefore they developed the initiative and self-reliance which had given to country doctors an honourable place in the medical service. To make rural practice attractive to the best type of doctor mileage allowances should be increased and many other improvements effected, one of them in particular being the establishment of cottage hospitals in country areas.

Dr. A. **Staveley Gough** (W. Hertfordshire) said that the time had come when the contact between general practitioners and hospitals could be implemented. The possibility of the unification of hospitals should open up extra accommodation. The present economic and domestic position was driving into hospital many patients who would normally be treated at home, and there was a danger that the average doctor would find that all his interesting cases which were reasonably within his competence would pass into a hospital. Certain hospital accommodation should now be set aside for general practitioners so that they might continue to look after their cases while in hospital, subject only to the requirement that the patient might have to be handed over for specialist treatment.

Dr. **Peter Macdonald** (Deputy Chairman) said that some representatives might be aware that he had long held the view that it was desirable for general practitioners to have, wherever possible, access to patients in hospital. This had not been achieved on account of the acute shortage of hospital beds, at least in the voluntary hospitals, the number of beds being no greater than was needed by the consultant and specialist services. It was always more important that a bed should be available for a perforating appendix than for a case of bronchitis, even acute bronchitis. It was a defect in the interim report of the Commission that it was nowhere stated that a greater number of hospital beds was needed in this country, especially for general practitioner cases. Dr. Macdonald added that he had discussed this matter on previous occasions, especially in the Hospitals Committee of the Association, and he had met with opposition, mainly from consultants. The burden of the opposition was that the difficulties of allowing general practitioners to follow their cases into hospital were too great. In the report of the Voluntary Hospitals Commission, in connexion with the payment of staffs of such hospitals, it was stated that if the principle behind this arrangement was sound and payment should justly be made, the difficulties should be faced and in time overcome. The access of general practitioners to the hospitals would do more to advance the science and art of medicine in this country than anything else except co-operation between general practitioners themselves, a principle which that meeting had already approved.

The **Chairman**, speaking for the General Practice Committee of the Commission, stated that this subject had not been forgotten, but the Committee had not yet reached the point in its deliberations at which it was able to deal with this problem. It looked upon the problem of the admission of general practitioners to the hospital service as one of the first things to be dealt with when the present meeting was over.

Dr. A. **Beauchamp** (Birmingham) objected to the use of the word "normal" in front of "confinements" in the motion. It rather implied that general practitioners were not capable of attending abnormal confinements. The mover agreed to the omission of the word "normal," and the motion in this form was carried without dissent.

Selection of Hospital Staffs

Mr. **Donald Watson** (Bradford) moved that in regionalization the university with its medical school would be the centre of education, but that in the election of candidates for hospital and other appointments within the region, the influence of the university should be limited in order to allow freedom of competition and the safeguarding of opportunity to candidates from outside the region. He thought that this was a very important safeguard, and that in order to maintain a high level of medical education the competitive spirit should be encouraged.

The **Chairman** said that the interim report expressed this point less crudely when it said:

> The selection of consultants and specialists for appointment to the staff of hospitals, or groups of hospitals, in the region or to the region as a whole should be made on the advice of a medical appointments panel specially appointed by the regional council or authority. The panel should include representatives of the university or universities in the region and, for certain senior appointments, assessors from outside the region.

The Bradford motion was carried.

Vote of Congratulation

Dr. J. A. **Pridham** said that he did not think that the Representative Body should pass from this part of the Agenda without expressing its congratulations to the Chairman of the Commission and to the Secretariat for this excellent interim report. It had astonished him that so complex and controversial a subject could be condensed into a few pages. He read a letter from a Surgeon Commander on active service, a former secretary of his Division, who said, "I think that the B.M.A. has gained tremendous kudos in this war, both as a result of the work of the Emergency Committee and the work of the Medical Planning Commission." Dr. C. M. **Stevenson** seconded the proposition, which was carried by acclamation.

The **Chairman of Council** said that he was grateful for this compliment, but he added that the work was very thoroughly divided up among the different Committees, each of which put a great amount of time and energy into the investigation of the subject allotted to it. But without the splendid work of the Secretariat it could never have been brought to a coherent conclusion. Dr. G. C. **Anderson** said that he could not let this occasion go by without stating who was mainly responsible for drafting the interim report. It was his colleague, Dr. Charles Hill, with the assistance of Miss Saxby. (Applause).

The meeting then turned to the remaining business on its Agenda; a report of which will appear next week.

Correction.—Dr. J. Vaughan Jones asks us to correct an obvious error in the report of his remarks at the Annual Representative Meeting, with reference to the Bromley resolution on whole-time salaried service (*Supplement*, Sept. 26, p. 34, col. ii). "The soul-destroying effect of democracy" should read, "the soul-destroying effect of bureaucracy, etc."

MEDICAL PENSION SCHEMES

One of the most effective methods of assisting the national effort at the present time is some form of regular saving. The individual will thus be curtailing his spending power, which is precisely what the national savings drive and the extension of rationing are intended to secure. Further, such saving means that the individual will have additional capital or income to spend when the war is over, and the need for it will be acute for the creation of employment. Restriction of spending power now is imperative if inflation with its devastating consequences is to be avoided.

Any national health insurance practitioner or member of the B.M.A., provided he is not over 64 years of age, *no matter what his state of health may be,* has an opportunity in the next few months to assist the national effort by taking a savings policy under his own pension scheme and with very profitable results to himself. But the present terms are to be withdrawn at the end of the year, after which time no applications for entry on the same terms will be considered.

The financial advantage to the practitioner himself of using his own scheme as a method of regular saving may be illustrated best by comparing the results he will obtain with those he might get (at least in theory) by the alternative method of periodical purchase of some form of Government loan. If it is assumed that he sets aside a sum of £50 per annum in this way and could ensure the investment of the interest thereon annually (to secure the benefit of compound interest) all at a rate of 3% per annum (though many people might regard this as too optimistic), his money would, of course, actually be earning, after payment of income tax at 10s. in the £, a rate of 1½% per annum net.

The following table will show how his savings made in this way would accumulate as compared with the result of investing the same net sum of £50 per annum (allowing for the income tax rebate to which he would be entitled on his contributions) in his own scheme.

If Withdrawal at End of Year	Result from an Investment of £50 per Annum	
	In Securities yielding 3% per annum less Income Tax at 10s. in the £ and assuming all Interest is Reinvested annually at the Same Rate	Paid as a Contribution to the Medical Pension Scheme, allowing for the Income Tax Rebate of 3s. 6d. in the £, subject to Statutory Limitations
5	£262	£331
10	£543	£715
15	£846	£1,161
20	£1,174	£1,677
25	£1,525	£2,276

Thus, for example, for a practitioner aged 50 who continued his investment till age 65—namely, for 15 years—the scheme shows a net profit over the ordinary 3% investment of £315 (entirely free of tax) or the equivalent of over 6 years' contributions. In the case of a practitioner starting at age 40 and continuing until age 65—namely, for 25 years—the scheme shows a profit of £750, or the equivalent of 15 years' contributions.

The following conditions and advantages are secured by a practitioner who contributes for what is called the pension benefit under the scheme: (1) In the event of withdrawal at any time or of death the whole of the contributions he has made will be returned plus 3% per annum compound interest. As this 3% is free of tax it is, of course, equivalent to 6% if earned in ordinary investments with income tax at 10s. in the £. (2) Subject to statutory limitations he will be entitled to an income tax allowance on each contribution he makes, and this is now at the rate of 3s. 6d. in the £, and amounts to exactly the same thing as an immediate dividend at the rate of 17½% free of tax. (3) If he remains in the scheme until he is between the ages of 55 and 65 he will then be entitled to take a pension for the remainder of his lifetime (or a pension jointly for himself and his wife) and guaranteed for a minimum of 5 years on terms which are far superior to any that can now be obtained in the open market.

Every facility has been arranged for the payment of contributions under the scheme direct to the Medical Insurance Agency or automatically by the practitioner's bank under a banker's order form. Normally contributions will be accepted quarterly.

So far reference has been made only to the pension or savings policy which can be taken separately under the scheme without any evidence of health. There is also a family provision benefit which can be taken separately or in combination with the savings policy, but subject to some evidence of health. For a quarterly contribution of £3 (on which income tax allowance may be claimed) at any age up to 64, a practitioner secures that in the event of his death his beneficiaries will receive an income of £100 per annum free of tax until he would have reached age 65 if he had lived. An income of from £50 to £250 per annum may be insured in this way. Civilian war risks within the United Kingdom are included.

As to the security of savings invested under these schemes, the benefits are guaranteed by any one of the three life assurance societies which may be chosen. An eminent mathematician said many years ago: "There is nothing in the commercial world that approaches even remotely the security of a well-established life office." The Legal and General Assurance Society, which is one of the three offices issuing policies under these schemes, and has issued by far the largest amount of the three offices concerned, has been established 106 years. Its accumulated assets exceed £50,000,000. It has just distributed profits to its policyholders at the full pre-war rate—a rate which it has now maintained for more than 50 years.

While the urgent need for individual saving at the present time may have made it desirable to emphasize the value of these schemes from a saving fund or investment point of view, it should be borne in mind that the primary object for which they were instituted was to enable a practitioner to secure for himself, or for himself and his wife jointly, a pension for life on retirement. It is hoped that in their own and the national interests doctors will now make every effort to join these schemes with whatever contribution they can afford, and secure the present exceptional terms while they have the opportunity of doing so. Any inquiries should be addressed to: The Medical Insurance Agency, B.M.A. House, Tavistock Square, W.C.1, and it will save time if an inquirer will state the date and year of birth, and the amount he may be prepared to invest by way of quarterly or annual contribution.

Correspondence

A Certification Problem

SIR,—Owing to pressure of work, shorthandedness, and the need for conserving petrol and tyres, a difficulty has arisen in this country practice the solution of which should be of interest to practitioners similarly placed.

The various villages here are visited on certain days of the week. On the whole, both panel and private patients limit their requests for visits to these days except when the matter is urgent. The difficulty is best presented by a concrete example. One afternoon the mother of an insured patient rang up to say that her son had been sent home with mumps. Since I had been in the village that morning and since the boy did not seem at all ill she thought that the visit could wait until I was next in the village. Should she cycle to the surgery and get a certificate? The village in question was 7 miles away. I put the difficulty to the local clerk to the committee and he in turn put it up to the Ministry, and almost by return a helpful reply was received. I append it with the permission of the Ministry:

"I am directed by the Minister of Health to refer to your letter of August 7 and the enclosure thereto on the subject of the insertion of the date of examination on a National Health Insurance medical certificate and to say that, as the Committee are aware, the ante-dating of a certificate would be a breach of Rule 7 (1) and (2) of the Medical Certification Rules, but that if the doctor is satisfied at the time of examination that the patient was incapacitated from the day preceding the date of examination the Minister thinks that the doctor might explain in the 'remarks' space on the official certificate or in a separate note his reason for not signing on the earlier date and for being satisfied that the patient was incapable of work from that date, and the Approved Societies would then have the proper evidence before them to enable them to consider the question of the payment of benefit."—I am, etc.,

C. M. DOUGLAS.

Market Deeping, Peterborough

Aid for the Overworked G.P.

SIR,—Under the above heading Dr. Kinnear Brown (*Supplement*, Sept. 12, p. 27) contributes a most interesting letter. A perusal of this letter only serves to show how far wrong one may go, even with the very best of intentions. Panel practice is quite simple and easy. As soon as the patient is seated, or before if possible, one starts to write out for him a first certificate, a certificate for his employer, a certificate to excuse him from fire-watching, a certificate for extra milk, one for an extra supply of eggs, one for replacement of his truss, ditto for his attenuated elastic stocking, two for his private clubs, four signatures upon his mother-in-law's pension book, and a prescription for some medicine. If anything is left out he will tell you. If there is a difficulty in the diagnosis he will resolve it for you. It then only remains to bid him good morning, telling him at the same time when he must attend again for a further supply of certificates; this last is the essential part of the service, and it is a part which many forget, to their cost. What the N.H.I. needs is bigger, better, brighter, and bulkier certificates.

Dr. Kinnear Brown has some remarks to make about "energy for clinical work." I am loath to interfere here. All that can be said is that if the doctor does not know better at this time of day than to make reference, even in a small way, to clinical medicine then he has missed entirely the whole crux of the matter. From such wrong thinking proceed all our bottle-necks; upon such uncertain foundations are placed our cross-sections and blue prints, our vested interests and scheme-making authorities. Dr. Brown must pull himself together and make a pincers movement; go all solid for fluidity: get social and dig for victory. I must send him a copy of my book "The Certificate in Peace and War: a Social Study of Interdynamic Prepotentialities," second edition, 9½ × 6¼ in., pp. 137 + vii, with four blue prints and seventeen cross-sections, 1939, London and New York: Pretty Press (15s. 6d.).—I am, etc.,

Selby, Yorks. J. C. GILLIES.

H.M. Forces Appointments

## ARMY

The following Consultants have been granted the local rank of Brig: Cols. (acting) D E. Bedford, R A M C, and H. C Edwards, R A M C; Lieut.-Col. (temp. Col) A. H Whyte, D S O, R A.M C., T A.

Col. A L. Stevenson, late R A M C., retired pay, has reverted to the rank of Major at his own request whilst employed during the present emergency.

Lieut-Col. W H S Burney, R A.M.C, retired pay, has reverted to the rank of Major at his own request whilst employed during the present emergency.

ROYAL ARMY MEDICAL GORPS

Lieut-Col. R A Flood, M C., having attained the age for retirement, is retained on the Active List supernumerary to the establishment

Major (temp. Lieut.-Col) D. Crellin, M.C, to be Lieut-Col.

Temporary Commission—War Subs Capt W M Hamer has relinquished his commission and is granted the rank of Capt.

TERRITORIAL ARMY, R.A M.C.

Capt R H Barnes has relinquished his commission on account of ill-health and is granted the rank of Major.

Supern. for Service with Queen's Univ, Belfast, Senior Training Corps (Medical Unit).—J. W Millen to be Lieut.

LAND FORCES EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Capts. R. S Nixon, A. S. Hoseason, and T R Hill have relinquished their commissions on account of ill-health, and are granted the rank of Major

War Subs. Capts A E H. Reid, G. Apthomas, J A. Barrie, T. Gadian, M Golding, J B C. Madge, D G Robinson, and A P. Egerton have relinquished their commissions on account of ill-health and are granted the rank of Capt

Lieuts G. A. W Angus and C. Exell have relinquished their commissions on account of ill-health and retain their rank.

To be Lieuts: R F Ashwin, W J Atkinson, J Boyle, W E R Branch, J. G. Craig, D O Davies, T. S. Donovan, E L. Edmondson, J. A Fernandez, J H Gifford, N M. Green, G. M. Greig, E S Harverson, C. PETROL FOR MEETINGS

Inquiries received show that there is some doubt as to the propriety of travelling by car to attend scientific meetings, including meetings of local Divisions of the B.M.A Medical practitioners, in common with other car users, are prohibited from using petrol for such a purpose. The Loca Medical War Committees, however, are in a special position as they are engaged in essential war work, and there is no objection to members travelling by car to meetings of these committees when other means of transport are not reasonably practicable.

DEATH

MURISON—On Sept. 20, 1942, at Wrington, Somerset, Cecil Charles Murison, Colonel, I.M. (ret.), after a long illness bravely borne. (Age 68 years)

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY OCTOBER 17 1942

ANNUAL REPRESENTATIVE MEETING

Thursday, Sept. 10 (*concluded*)

On the last day of its meeting, with Dr. H. G. Dain in the chair, the Representative Body dealt with the remainder of the Annual Report of Council (the first part of the report having been dealt with on the first day) and the miscellaneous motions from Divisions. Two further motions under "National Health Insurance" were agreed to, the first, by North Staffordshire, asking the Council to exercise all vigilance to prevent a repetition of events whereby recently those up to an income limit of £420 were included within the Acts, and the other, by Hendon, urging that the approved societies should be compelled to accept all insured patients irrespective of their state of health.

PUBLIC HEALTH

Prof. R. M. F. Picken, on behalf of the Public Health Committee, accepted for consideration a motion by Cardiff that, if the Council could not obtain a satisfactory solution of the question of compensation for medical officers injured in air raids, the alternative procedure of medical officers being enrolled as volunteers under the local authority for national service, using Form E.D.60, should be investigated.

A motion by the City of London expressing satisfaction at the campaign which the Minister of Health is conducting to extend immunization against diphtheria, and offering him the Association's full support, was agreed to, as was a further motion expressing grave concern at the increased incidence and death rate of pulmonary tuberculosis. This latter motion urged that wider powers should be available for providing financial aid so that no person should be deterred from accepting a full course of treatment, and that there should be more adequate institutional accommodation. It declared that long hours of work were bound to have a deleterious effect upon the general health and the resistance to the disease among workers. Dr. J. A. Brown (Birmingham) said that the insistence upon long working hours, often spent in bad conditions as to ventilation, was a cause of much minor illness and absenteeism.

THE ASSOCIATION IN SCOTLAND

The report under "Scotland" was presented by Dr. T. Fraser, chairman of the Scottish Committee. He mentioned that schemes under the Maternity Services Act were now coming along more favourably. A motion by the Lothians asking Council to consider the desirability of the chairman of the Scottish Committee being, *ex officio*, a member of the Council during his tenure of office, was carried.

"BRITISH MEDICAL JOURNAL"

Dr. J. C. Matthews, acting chairman of the Journal Board, presented the report under this heading on behalf of Col. R. G. Gordon, who is on foreign service. He complimented the editorial and business staff of the *Journal* on the way in which they had surmounted many wartime difficulties.

INDUSTRIAL HEALTH

Sir Kaye Le Fleming introduced the report under "Industrial Health" and mentioned the useful special report which the Industrial Health Committee published in November, 1941. Dr. Mona Macnaughton mentioned some friction between general practitioners and industrial medical officers. Dr. T. Craig spoke to the same effect: the main troubles arose out of certification and the fact of treatment given at the works. Dr. J. W. Bone said that some time ago the Association established a code of rules and thought at first that the service was being conducted in an excellent way, with careful observance of the code, but in recent months the code had been flouted. Dr. S. Wand said that it was not the whole-time industrial medical officers who were responsible for the difficulty, but the part-time officers, who were their own colleagues in general practice. He suggested that the Divisions should take up this matter in the same way as they took up any other ethical question. Mr. J. Livingston (Barrow-in-Furness) confirmed the fact of trouble arising between industrial medical officers and men in general practice. Dr. I. D. Grant (Glasgow) said that under their terms of service part-time officers were not permitted in any way to treat sick persons; they attended factory accidents and looked after factory welfare.

Dr. P. Inwald moved: "That in view of the importance of the health of the worker in the war general practitioners be appointed on a part-time basis to all factories not employing whole-time medical officers, and further co-operation between factory medical officers and general practitioners be facilitated." A system should be devised for an interchange of relevant knowledge between the patient's doctor and the factory medical officer. Dr. Wand said that this matter was under the consideration of the Industrial Medical Service Subcommittee. The medical man-power question was now acute in many areas, but encouragement of this interchange had been the policy of the Association for some time past. The motion was adopted.

OPHTHALMIC SERVICES

Mr. Bishop Harman, in moving the report under this heading, said that the past year had been a record one for the National Eye Service. The number of ophthalmic practitioners on the list was close upon 1,000. He described the negotiations for an increase of fees, which, having regard to the expenses of consulting practice, were too low. The approved societies had met his committee and opened up the difficulties of their own position. They had agreed, however, to a certain proposition, which the Ophthalmic Committee would meet to consider. They had pointed out that any distinction between insured persons on the basis of income—that is, between those with less than £250 and those between £250 and £420—would be impossible for the societies to carry out administratively. That, again, was a matter for further exploration.

Dr. Lucas Young (Eastbourne) moved an amendment to a motion by Plymouth. The motion was one disapproving of the inclusion in the National Eye Service of all persons and their dependants with incomes over £250 per annum, and to this he moved to add "unless a higher fee is payable by this group of patients." He said that the majority of those in the N.O.T.B. would not object to the inclusion of the £250-£420 persons in the National Eye Service if a fee of one guinea was paid, but to include these persons for the very nominal fee of half a guinea would be an unwarrantable intrusion into the preserves of what was now private practice. Dr. C. M. Stevenson (Cambridge) urged that this proposal be not adopted as it would tie the hands of the Ophthalmic Committee and cause administrative difficulties. Dr. Peter Macdonald suggested that both motion and amendment be referred to the Council, and this was agreed to.

THE ASSOCIATION OVER-SEAS

The Chairman of Council said that it was customary at Annual Representative Meetings to hear messages from oversea representatives, but on this occasion for obvious reasons this was not possible. He felt that the Representative Body would like to send a message of remembrance and sympathy to their brethren in all the oversea Branches. The message was sent with the utmost cordiality. On the suggestion of Dr. John Clayre (Southampton) the Channel Islands were included.

CENTRAL MEDICAL WAR COMMITTEE

The Chairman of Council presented the Annual Report under "Central Medical War Committee" and gave some account of the work of the committee and of its subcommittees. The demands made for medical men for the Forces were enormous and increasing. It had been hoped that by the end of September a certain peak would have been reached and they might relax their efforts. These hopes had been disappointed, and further demands would have to be made upon the medical profession. Practically the whole of the young men entering the profession were recruited to the Forces, and did not go to replace wastage in civil practice. In addition to compulsory requirements very large numbers of medical men had voluntarily given their services. It was not through the hardness of heart of the Central Committee that further demands were being made. It had been suggested that the distribution of men as between the civil population and the Forces was not fair, and that the Forces were making too great demands. To examine that subject the

Minister appointed a Priority Committee to decide priorities between the civil population and the Forces and between the different components of the Forces. The Forces had put forward their difficulties in the most open manner, giving information that could not be publicly disclosed, and they had satisfied the committee that now, after a certain amount of pressure, they had come down to the absolute minimum of demand. Members of the profession might be absolutely sure that the C.M.W.C. never asked for a medical man unless satisfied that his service was essential to the progress of the war. On the other hand, owing to the splendid work of the local medical war committees, it had been possible so far to meet the enormous demands that had been placed upon them. The profession in this country had been gravely depleted, and its members were having to work twice as hard as they would work in normal times. Many of them had to go on working after they would normally have retired. He concluded by expressing the gratitude of the Central Committee to the local committees for the way in which they had responded to their demands. "We work on a very solid basis. Our demands are on the basis of real necessity." (Applause.)

Correlation of Medical Services

Dr. T. M. Fripp (North-East Essex) moved:

> That this meeting notes with concern the present wastage of medical personnel and suggests that the Council should approach H.M. Government with a view to correlating the medical services of the Navy, Army, Air Force, and Civil Defence under one head.

He said that, as now constituted, four or five medical services—the Navy, the Army, the Air Force, and the Emergency Medical Service, as well as civilian general practitioners—were in watertight compartments, and each was practically independent of the others. The whole of the medical services should be organized under one head. The supply of doctors was not inexhaustible, and it was better to look ahead and work out a plan of redistribution of medical man-power. Dr. J. A. Brown said that this question had been considered by the Priority Committee. The suggestion was an impracticable one, but the committee was satisfied that a great deal of the overlapping and some of the wastage that came into existence before the Priority Committee was set up had now been rectified. The motion was lost.

Secretariat of the C.M.W.C.

Mr. H. J. McCurrich (Brighton) moved:

> That, as one of the functions of the Secretariat of the B.M.A. is to advise and assist the members of the Association, this meeting is of the opinion that it and the Secretariat of the Central Medical War Committee should not consist of the same men.

He was anxious to point out that this was not a criticism of the committee or of the secretariat. No one had a higher regard for Dr. Anderson and his staff than he had himself, and Dr. Anderson had combined the two functions more ably than any man alive could have done. It was entirely a matter of principle. There had been in many quarters a feeling of dissatisfaction that the rank and file had no longer a free and independent Association to safeguard their interests. Whether that feeling was right or wrong was not now under discussion; the point was that it should not have been possible for such a feeling to arise. At times a member might feel that in the matter of recruitment for the Forces he had not been treated quite fairly, but that the officials of the Association to whom he would ordinarily go for guidance were not free people, because they constituted also the secretariat of the body which had decided against him. Dr. W. D. H. Waddington (West Sussex) supported the motion.

Dr. C. M. Stevenson, as chairman of a local medical war committee, appealed to the meeting not to take away the present secretariat. It had worked perfectly. If a new one were appointed a clash would be almost inevitable. Dr. R. W. McConnel (Bucks) also said that it would be a disaster to separate the two secretariats. Dr. J. A. Brown said that there might be some disadvantages in having as the secretariat of the C.M.W.C. the same people as constituted the secretariat of the B.M.A. But he was not really aware what the disadvantages were, and he was conscious of many advantages. He hoped that instead of pressing this motion the meeting would pay a tribute to the magnificent work done by Dr. Anderson and Dr. Hill. Had it not been for their work the recruitment of medical men would have been in an "absolute mess." Mr. McCurrich protested that he had tried to make it plain in moving the resolution that this was no question of personal attack, but purely a matter of principle.

The motion was put to the meeting and was lost by a very large majority.

Dr. Anderson, speaking as Secretary of the C.M.W.C., made a private statement on the recruitment of medical men for the Army. After making the statement he said that his object was simply to impress those present with the seriousness of the situation and to ask the members of local medical war committees to revise their lists and, if short of the quota, to make an effort at once to give the number of men they had been asked to give. With regard to the motion by West Sussex and Brighton, he fully understood that the intention of the movers was not to make any personal attack upon himself or his colleagues, but to attack the principle whereby a double office was held by the same individuals.

Medical Posts for Civil Defence

Dr. D. O. Twining (Plymouth) moved that the selection of medical officers for Civil Defence, Observer Corps, and similar appointments should be made only in consultation with and by approval of local medical war committees. He said that certain instances had occurred in his district which had led to this motion being framed. Such appointments must be made through local medical war committees if the medical personnel in the various areas was to be put to the best use. The motion was carried.

Dr. Anderson said that care must be taken not to put forward any plea that the profession should make nominations for routine appointments by local authorities. The motion just carried was, he thought, intended to refer to wartime allocations in connexion with Civil Defence, and in that field the meeting could quite well agree to it.

Mutual Help Committees

Dr. C. I. Schiff (City of London) moved a recommendation to Divisions to set up *ad hoc* committees for the purpose of securing mutual help among local practitioners—e.g., rotas for night and emergency work to meet the increasing strain as more and more doctors were drafted into the Services. The isolation in which general practitioners had worked would be to some extent mitigated by such a measure, and it might be found that in a year or two a good many of the objections raised against a State Medical Service would be largely overcome as a result of demonstrating that some such form of co-operation was already in existence. The Chairman suggested that the motion should be made less mandatory and Divisions should be left to take any necessary steps in their own way. Dr. C. F. T. Scott (Willesden) said that many local medical war committees had already moved in this direction. The Secretary said he believed that the action contemplated in the City motion might be better undertaken by the local medical war committee than by the Division, because the former was thoroughly familiar with the work the men were doing and knew the allocation of work among the men on the Register. This alteration was accepted by the mover, and in that form the motion was carried.

Dr. R. W. McConnel moved that a hearty vote of thanks be accorded to Dr Anderson, Dr. Hill, Dr. Macrae, Dr Craig, and their staffs for their work as the Secretariat of the Central Medical War Committee and the Scottish Medical War Committee, and for the great help they give to local secretaries. He had special reason to compliment Dr. Anderson and his staff for their patience in answering questions, the more so as many of the questions, while important from the local point of view, must appear trivial when viewed centrally. The motion was carried by acclamation. Dr. Anderson thanked the meeting on his own behalf and on that of his colleagues and staff. He said that none of them could have any idea of the work which the staff had put in. He had the most loyal staff anyone could have.

METHOD OF ELECTION OF COUNCIL

Dr. S. W. Swindells (Grimsby) moved to amend the by-law relating to the election of Council by groups of Branches and Divisions, so that the voting papers should contain no particulars regarding the candidates other than their addresses. Dr. S. Wray (Lincoln) said that his voting group comprised five counties, and it was impossible for a candidate to make himself known to all the members; probably 70% of the electors never saw a candidate for the Council. If the candidate's age could be given on the voting paper it would furnish some indication of his outlook. Dr. J. C. Matthews, as chairman of the Organization Committee, while expressing no views on the merits of the proposal, pointed out the unwisdom of altering by-laws without the help of the solicitor. Dr. N. E. Waterfield hoped the meeting would not pass this motion. He agreed that a long list of appointments appearing on the voting papers was not worth the paper it was written on, but one qualification might appear. Dr. D. T Whitaker (Guildford) said that he had never heard before of an electoral procedure in which the qualification for election was that the constituency should know nothing about the candidate. any candidate had done service for the Association that should be mentioned the voting paper. Sir Kaye Le Fleming said that there was nothing the Association needed more than for young men to come along and prove their worth. There was no desire of the "Old Guard" to sit in office and keep other people out.

The mover consented to amend his motion so as to include the candidate's age as well as his address on the proposed voting paper, but the motion was lost.

ORGANIZATION OF GENERAL PRACTITIONERS

Dr. D. L. S. Johnston (Halifax) moving: "That the Association shall promote and recognize the organization of general practitioners under the auspices of the Association, and that this body shall be controlled by general practitioners," said that this was put forward to safeguard the future. There were still a large number of doctors outside the Association, possibly because of apathy or from a sense of frustration. In Halifax an organization of general practitioners had been formed, and a unity had been brought about among them, together with a realization that the B.M.A. offered the only way in which their position could be maintained. Dr. Wand said that the General Practice Committee was composed almost entirely of general practitioners, and in order that it might more adequately represent that side of the profession its constitution was altered not many years ago. If some arrangement at the periphery was wanted he saw no objection to the setting up in the Divisions of local general practitioner groups. Dr. J. G. McCutcheon (Glasgow) thought it would be detrimental to the Association to set up another organization of this kind. The Secretary reminded the meeting that the Council had set up a committee to go into the whole question of the organization of the Association, and he suggested that the best plan would be to refer the motion to that committee. This course was approved.

MISCELLANEOUS MOTIONS

Dr. T. Craig (Newcastle) had a long motion on the continued marketing of proprietary remedies of no proved therapeutic value, recommending that action be taken by the Association to protect the public from such exploitation. Such action would aim at the withdrawal of preparations not proved to be therapeutically active, the substitution of statements on the pharmacological action of preparations for the names of diseases which it was claimed that they relieved, the publication of the formulae of all such medicines, with the detailed composition, including excipient, of a single dose stated on every package, and the use of the terminology of the *B.P.* for the naming of official, and of the English language for unofficial, ingredients. The motion was referred to the Council, with a view to consideration by the Science Committee.

Dr. C. M. Scott (Barnet) moved a resolution of protest at the fees payable under the proposed Hospital Service Plan for London to the patient's own doctor. While he approved the Plan in general he deplored the fact that the Association should have agreed to such totally inadequate professional fees. Dr. F. H. Bodman (Bristol) said that if the Plan was analogous to schemes in the Provinces, the meeting should be aware that the fees set out under the scheme were reduced fees. Radiologists and others were accepting one-third or one-half their customary scale. He felt that the Association had acted wisely in supporting the scheme in view of the needs of people with from £250 to £700 a year. The Deputy Secretary said that this scheme of the King's Fund, which applied to Greater London, was intended to provide on an insurance basis for persons within stated income limits consultant and specialist services in the private wards of a hospital or in a nursing home. It was not intended to be an insurance scheme for general practitioner services. But it was pointed out that in small hospitals without a resident the attending general practitioner would in fact be rendering service for which he should be paid, and accordingly this one general practitioner provision was made. But any practitioner who undertook specialist work would receive the specialist fees. The scheme, however, had now been postponed until after the war and had been replaced by a scheme on a grant-in-aid basis in which there were grants to practitioners who attended their patients, whether as specialists or not, in private wards or nursing homes. The mover expressed his satisfaction, and the motion was withdrawn.

Dr. G. C. Barron (Sheffield) moved to instruct the Council to engage the whole-time services of a barrister of repute to make a close study of medical law and economics so as to be prepared to give advice in the preparation and presentation of the Association's case in any future negotiations. Dr. W. E. Dornan said that the idea which Sheffield had in mind was that counsel of repute might be employed at a salary of £5,000 a year. ("Oh!") Business organizations in his part of the country paid as much as that. The Chairman of Council said that the motion was an entire misconception of the manner in which negotiations were carried on. They did not approach the Ministry of Health, for example, as a body attacking it by some legal process; they went to discuss matters in a spirit of friendly argument. Moreover, the Association had in its service one of the ablest solicitors in the country, who was expert in its affairs and was backed by counsel fully alive to its requirements. The motion was lost by a large majority. A further motion by West Sussex—that in negotiations with the Ministry of Health there should be a unification of presentation of medical opinion, and a drawing together of the several bodies now existing for that purpose—was also lost.

Dr. J. Beck (Glasgow) asked for an examination of the feasibility of an "all-in" compulsory Association, with disciplinary powers, embracing doctors, dentists, and nurses, so that it could speak with a united voice in all matters affecting the health of the community. Dr. W. D. Anderson said that Glasgow felt that the Association's methods of negotiation were not adequate to the new situation, and that the profession should put its house in order. They also felt that the General Medical Council failed to exercise a proper discipline. Dr. E. A. Gregg said he was very much in sympathy with the ideas behind the resolution, but how was this compulsion to be exercised? The motion was lost by a large majority.

Dr. P. S. Marshall (West Norfolk) moved that a new scale of minimum fees be laid down for all part-time work for public authorities, Government Departments, and societies, the negotiations to be carried out by the Association on a national basis. The motion was referred to Council. A motion by Plymouth, that all medical appointments made during the war should be for the duration of hostilities only, was carried; it was, said the Chairman, the policy of the Association. Dr. Barbara Abercrombie (Liverpool) asked the meeting to condemn the practice whereby manufacturers of oxygen withheld the supply of commercial oxygen at retail commercial prices to the medical profession. It was agreed to refer this matter also to the Council.

Dr. D. T. Whitaker (Guildford) had down a motion asking the Council to take steps to make available to civilian practitioners the medical history of men or women discharged from the Services for medical reasons. Dr. J. A. Brown pointed out that what was desired was to have the reasons for the discharge made accessible—the machinery could easily be arranged—so that the information became available automatically to the patient's doctor. He could not understand why the Ministry of Pensions placed any difficulty in the way. The Chairman said that he himself was in the process of trying to find from somebody the medical record of a patient who had come under his care, and so far he had failed. He thought the Council might try to set up some method whereby the reason for a patient's discharge from the Services, when the reason was a medical one, could reach his doctor. The motion was carried.

Sheffield asked the Council to encourage investigation into the possible danger from respiratory obstruction due to displacement of the epiglottis under anaesthesia, and also in asphyxia neonatorum. This was accepted for reference to the Science Committee.

Dr. W. E. Dornan, in proposing a vote of thanks to the Chairman, Dr. Dain, said that no eulogy could be high enough for the way in which he had steered that meeting through 250 motions and amendments. The motion was carried unanimously and with applause. Dr. Dain, in acknowledging it, "passed the bouquet" on to the representatives. In two and a half days not more than two or three speakers had wanted to exceed their time limit. The conduct of an extremely difficult meeting had only been possible by an occasional trespass by the Chair on the rules of procedure and by the never-failing kindness of the meeting.

The Representative Body sat for 4½ hours on the first day, 7½ hours on the second day, and 5½ hours on the third.

We have received from the Hon. Secretary (Dr. C. W. H. van der Post) of the Natal Coastal Branch, Medical Association of South Africa (B.M.A.), a full report of the Branch's activities for 1941, which reflects the difficulties, due to the war, with which oversea members have to contend. Sixty doctors, including some of the Branch's most energetic supporters, are on active service, and this depletion meant unfortunately less time for Branch meetings for those who must stay behind and carry on. Nevertheless the Branch Council has been busy, and its 12 meetings, at which a wide variety of business was transacted, were well attended. Four Branch meetings, one of them a clinical gathering, were held. The Natal Coastal Medical War Fund was started in May, 1941, with the gratifying initial response of £1,079.

Correspondence

Medical Certification

SIR,—Through Government regulations, orders, circulars, etc., the life of a general practitioner has been turned into Insanity Fair. The English, in spite of constant experience to the contrary, preserve a touching faith in Acts of Parliament and in departmental legislation. If the B.M.A. has been "pressing the Government Departments concerned" for many months I have not yet observed or felt any relief from the intolerable burdens created by demands for certificates for every conceivable reason. There is an old story of a medical practice in Yorkshire which was run on three stock mixtures, so that when any patient trundled in he was met with the question, "What's yours: black, white, or brown?" We have made progress. To-day one has to ask each succeeding entrant, "What kind of certificate do you want?" It is no exaggeration to say that more than half of the committee which waits upon me twice daily is after some kind of medical certificate. Valuable time is wasted in investigating dubious claims and often in furious arguments with applicants who have no case at all, while those who have need of real medical attention have to be rushed.

As each Government Department intervenes with its rules and regulations it creates additional burdens for the medical profession. There are forms for milk, eggs, soap, pensions, clothing coupons for expectant mothers; forms for the Navy, Army, and Air Force, the A.T.C. and G.T.C., medical boards, the Panel (of various sorts, sizes, and colours), educational authorities, fire-guard exemption; forms for glasses and teeth, compensation, absence from work (accident and illness, factual or alleged), petrol allowances, and sick societies; and, if that were not enough—the list is by no means exhausted—the pharmaceutical chemists join in and decline to sell to their customers glucose, olive oil, rubber hot-water bottles, Horlick's milk, ovaltine, etc., without a medical certificate. And the corsetières, God bless them all, must have their forms for customers suffering from complaints not to be found in any textbook of surgery.

To all this a new racket is added. Every pretext and excuse is being trotted out to obtain an extra supply of coal in cases of illness, so that, when winter comes, we shall be inundated with applications for certificates to satisfy the local fuel officer. Meanwhile voluntary absenteeism among coal-miners is rapidly increasing; output of coal per man shift goes down, and no one seems able to offer any remedy for this appalling state of affairs. The medical profession must bear its share of blame in this matter. It is now over 21 years since I came to practise in this coal-mining district. Taking them by and large, the coal-miners are a decent, hard-working body of men. There are some very fine men among them—none better. But there is a section which uses every opportunity or occasion to play the absentee game. The trouble began when the Essential Works Order came into operation. Then a bonus was paid for putting in a full week's work, but if there was any absence from work even for a day a medical certificate was demanded. The scheme was a "flop." Wages were raised, and then a rise has been propounded based on an increase in regional output. For every day a man is off work he must produce a medical certificate, otherwise he is penalized by a fine. But the colliery managements are handicapped in their dealings with defaulters. If they are too stiff with them the men can transfer to other colliery companies, just as they can transfer their patronage to any other doctor who would perhaps be more obliging to them if their own does not please them.

For various reasons my surgery is filled daily with men who are seeking certificates for one reason or another: some with accidents which are genuine enough, some with genuine illness, a good many with dubious illness such as vague headache, "bad back," fatigue, "feeling nervous," and diarrhoea. It is astonishing how common diarrhoea has become and how rare it is in any other member of the family. In many of these "the plain evidence of facts is superior to all declaration." And then there are those—by no means an insignificant minority—who, having taken a varying period of absence from work, frankly demand a certificate to cover them for the back period without having in any way consulted the doctor. These are not isolated instances: they are a daily occurrence. I can only say in such instances that "I am informed" or that "A. B. states he has been unable to work on account of. . . ." This sort of certificate, which is no certificate at all, apparently satisfies the colliery manager or the pit production committee. Managers profess themselves hopeless and helpless to put a stop to this sort of thing. I have protested time and again about it, but the abuse gathers momentum instead of diminishing; meanwhile one's clinical work is handicapped, temper is torn to rags and tatters, and one is tempted sorely to take a cynic's way out—the line of least resistance.—I am, etc.,

Heanor, nr Nottingham. PHILIP TURTON, M.D.

State Medical Service

SIR,—Now that the idea of a full-time State Medical Service has been rejected by a 90% vote and our new president has so well expressed the feeling of the profession in his address, is it not time to give this subject a well-earned rest? Such a lot of thought and energy are diverted from the realms of pure medicine and science where medical interest would be better focused.

So many advocates of a State Medical Service adopt an attitude and use arguments more suited to Nazi swashbucklers than to members of a learned profession in a land which is fighting for democracy. The recent words of Gen. Smuts to a youth congress could very well apply to us: "Cling to what you have, uphold the freedom which has already been won, and guard against new slogans which have dragged so many countries in the old world to ruin." The war has yet got to be won if we are to have any future at all. For those State Medical Service enthusiasts there are the Services (R.A.M.C., etc.) crying out for men.

Little more remains to be said. We have had the matter discussed in your columns *ad nauseam*. The time has come to drop the matter and use your valuable space for more interesting and erudite subjects.—I am, etc.,

London, S E 1. W. B. J. PEMBERTON.

National Hospitals Board

SIR,—A meeting of the board of the Westmorland County Hospital was recently held to discuss the future of the hospital services. The following resolution was passed unanimously: "That this meeting is in favour of the establishment of a national board responsible to the Ministry of Health to administer all hospital services, such board to be formed of representatives of the different sections of the community and of the various interests involved, executive power being delegated to regional and local committees, none of them being under the control of local government bodies: the financing of such a scheme to be covered by an addition to the national health contribution rather than by an extension of the present voluntary contributory schemes."

The Westmorland County Hospital, with its affiliated maternity block, controls over 100 beds, and has been successfully operating for many years. Such a resolution, coming from a board one would expect to be conservative in outlook, is, I think, remarkable, and worthy of thoughtful consideration by all interested in future developments. I trust you will give it publicity for that reason.—I am, etc.,

Kendal. C. M. CRAIG.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY OCTOBER 24 1942

INSURANCE ACTS COMMITTEE

Application for War Bonus for Practitioners

The progress of recent endeavours to obtain a war bonus for insurance practitioners was reported to a meeting of the Insurance Acts Committee on Sept. 24. The chairman (Dr. E. A. Gregg) said that, following the last meeting of the Committee, an appointed deputation met representatives of the Ministry of Health, and later a reply was received from Sir John Maude, secretary to the Ministry, contesting the arguments which had been advanced. Thereupon an interview was sought with the Minister himself, which took place on Sept. 22, two days before the present meeting. Mr. Ernest Brown had replied that there was no money available in the pool for this purpose, and that he could take action only in one of two ways—either by going to Parliament to obtain quite fresh arrangements, or by a special war grant, which was against general Government policy. He also hesitated to commit himself in view of the immediate issue of the report of the Beveridge Committee, which might make recommendations recasting the whole of the arrangements. At the same time he promised careful consideration of the points which the deputation had advanced.

The report of the Minister's remarks was conveyed to the Committee, together with the cogent arguments advanced by Dr. Gregg, Dr. J. A. Brown, and other members of the deputation. It was agreed that the Committee should hold a further meeting before the Panel Conference in order to frame its recommendations following upon the receipt of the considered reply of the Minister.

(The I.A.C. is meeting on Oct. 22 to consider the Minister's reply.)

Insurance Practitioners and Medical Planning

The other principal subject which occupied the Committee was the replies received from Local Medical and Panel Committees to the questions posed in the interim report of the Medical Planning Commission. The definition of objects of medical service as set out in the draft report was generally accepted, and the principle of free choice of doctor and patient as an essential feature of the service was agreed to almost without qualification by the committees which had replied. Group practice in some form was also favourably considered by the majority of the committees, and the I.A.C. endorsed this view.

Longer debate took place on the question whether the provision, whatever its character, should be made by the Government for the whole of the community or for part of it only. The question of the 10% or 5% of the population remaining after insured persons and their dependants and others of like economic status had been dealt with was variously answered by the committees, but the I.A.C., by 17 votes to 6, adopted a similar resolution to one carried by the County of Ayr Panel Committee, that provision should be made only for persons compulsorily insured, their dependants, and others of like economic status. Other conclusions of the Committee, after considering the views of Panel Committees, were against the establishment of a whole-time salaried Government medical service, in favour of the two-way extension of National Health Insurance (to include dependants and others and to bring in consultant and specialist services), and, by a majoritv, in favour of the general principle of health centres; but a resolution of the Annual Representative Meeting was also passed by the Committee, that all registered practitioners should have a right to take part in the service and, so far as possible, a choice of the area in which they would serve. On the question of the method of remuneration of practitioners—that is, whether by a basic salarv plus a capitation fee or by some other method—the Committee expressed no opinion in the absence as yet of sufficient data.

Financial Assistance for Aged and Infirm Practitioners

With the Committee sitting as the National Insurance Defence Trust a discussion arose on the objectives of the allocations from the interest of the Fund for the purpose of enabling aged and infirm insurance practitioners to retire from practice. The Treasurer (Dr. Bone) reminded the Committee that this arrangement was instituted a few years ago in order to keep the service from the disrepute into which it might fall if practitioners by reason of age or infirmity continued to do insurance work when no longer capable of properly carrying out their obligations. It was intended to deal with those cases under which action under the Medical Benefit Regulations was contemplated or was likely to arise, but applications were now being made under the assumption, apparently, that the end in view was purely benevolent or charitable. Two applications had come before the subcommittee that day and had been adjourned because they had been made on behalf of practitioners who were ill and in poor circumstances, but against whom there was no suggestion that a complaint had been or was likely to be preferred. So far as the charitable motive was concerned, the B.M.A. had its own Charities Fund and there was also the Royal Medical Benevolent Fund, and the proper course would be for Panel Committees to subscribe to those. The Trust gave its opinion that the matter was one which should be clarified, and it is likely to be raised in one form or another at the Conference.

NATIONAL EYE SERVICE

Fee for Ophthalmic Medical Examination

The last meeting of the Ophthalmic Group Committee, held on Sept. 22, with Mr. Bishop Harman presiding, considered the report of a conference which recently took place between members of the National Ophthalmic Treatment Board and representatives of approved societies on the subject of the fee for ophthalmic medical examination. At that conference the approved societies' representatives, while not unwilling to discuss some increase in the fee charged to insured persons entitled to optical benefit, were unanimous in their opposition to any differentiation on grounds of income as between different classes of insured persons. The proposal of the Group Committee had been to make no change in the fee payable for insured persons and others in receipt of an income of less than £250 a year, but to charge an increased fee for the persons with higher incomes, including those with incomes up to £420 newly brought into National Health Insurance. The approved societies declared that such discrimination or means test would be administratively impossible, quite irrespective of the financial aspect. On the question of the amount of the increase, the societies also said that their funds could not possibly allow an increase to 15s. 6d., the figure originally approved by the Group Committee; they declared that the amount available for additional treatment benefits was fixed for them, not by them, after their quinquennial valuations.

The Group Committee agreed that a report of the conference should be circulated to their constituents, together with a further document, prepared by their chairman, showing the yield in total amounts which would be forthcoming under various proposed arrangements One member suggested that in the elections of the new Group Committee. which are to take place immediately, members should seek a clear mandate on this issue, but as against this it was pointed out that members were elected for a number of years and on many other issues. It was eventually agreed that a plebiscite should be taken forthwith, the position being clearly set out to the ophthalmic medical practitioners of the country, and that any action to be taken on the result of the plebiscite should be left to the new Group Committee.

National Eye Service after the War

A memorandum on a scheme for a National Eye Service after the war was submitted by a special subcommittee. It was considered useful to have such a document in existence in case at any moment in the various movements for planning and reconstruction occasion should arise for its presentation in authoritative quarters. The object of the scheme was described as the co-ordination of the ophthalmic services of the nation in order to provide the whole community with an efficient, economic, and accessible eye service, and its essential requirements were that examination of the eyes and treatment of eye diseases and defects should be carried out by those properly trained and experienced, that the scheme should be easy to administer and economically sound, and that its benefits should be accessible to all. The three units under the scheme were described as the ophthalmic medical practitioner—the only person competent to decide whether the case is one for correction of an error of refraction or other treatment—the refractionist, and the dispensing optician. The position and status of the refractionist were considered at length. Until some determined date the refractionist would be either a medical practitioner who wished to do refraction work or a sight-testing optician whose right to practise refraction must be regularized by legislation. After the determined date the non-medical refractionist would belong to an ancillary branch of the profession with a duly regularized training, qualification, examination, and discipline. The part to be played by the refractionist and the way in which his work should be controlled were duly set out. The document was very critically examined by the Group Committee and some portions of it were recast. It was agreed that the redrafted document should be submitted to the first meeting of the new Group Committee.

Industrial Subcommittee

It was announced that the N.O.T.B. was proposing to set up a small industrial subcommittee, with two members appointed by the Group Committee and two by the committee of the Guild of British Dispensing Opticians, with a view to arranging for the "servicing" of factories, not only examining the eyes of workers but advising on lighting and similar matters. The two members appointed for this purpose by the Group Committee were Mr. Bishop Harman and Mr. E. F. Preston.

Correspondence

National Eye Service

Sir,—Members on the B.M.A. list of ophthalmic medical practitioners will shortly receive a report drawn up in accordance with the conclusions of the last meeting of the Ophthalmic Group Committee. This report will deal with the possibility of attaining agreement with the approved societies on the fees for eye service to insured persons through the National Eye Service. Each member will be asked to put down his opinion on the questions set out before him. The summary of all these answers will be directions to the new Ophthalmic Group Committee (to be elected this month) in their work of negotiation.

There is one point I feel I must put before my colleagues in medical eye work. There can be no doubt that at the end of the present world crisis there will be changes in the arrangements of medical practice of all kinds, and no doubt including changes in medical eye work. When such changes are being considered by the medical profession and by Parliament our position as ophthalmic medical practitioners will be greatly influenced by the position at that time of the National Eye Service. If it is then working well, as it has been in the ten years before the war and particularly during the war, then it is certain that the position of ophthalmic practitioners will be weighty. Therefore I suggest to my colleagues that in answering the questions of the plebiscite they should think of the future even more than of the present. What we do now may have a great effect upon the future of efficient medical care of precious human eyesight.—I am, etc.,

N. Bishop Harman.

H.M. Forces Appointments

ROYAL NAVY

Surg Capt. H St C. Colson, C.B E., to be Surg. Rear-Admiral.

Surg Capt G. R McCowen, O B E., has been placed on the Retired List.

Surg Lieuts R McM. Latta, W. Wilson, B W. Walford, and J P T. Wellwood to be Surg Lieut -Cmdrs

Surg. Lieut. R E. Lauder has been transferred to the Emergency List.

G G Wallis to be Surg Lieut

Royal Naval Volunteer Reserve

Acting Surg Lieut -Cmdr. J Ronald to be Surg Lieut -Cmdr.

Prob Temp Surg Lieuts. R. Wadia, D W. Bain, J. W. M. Humble, and S C. F. Stephenson to be Temp. Surg Lieuts.

ROYAL ARMY MEDICAL CORPS

Lieut -Col. R D Davy, M C, having attained the age for retirement, is retained on the Active List supernumerary to the establishment.

Major (Temp. Lieut -Col.) T. P Buist to be Lieut -Col

Capt. (Temp. Major) R. St. J. Lyburn to be Major

Short Service Commission—Capt A H. T F. Fullerton has been placed on the half-pay list on account of ill-health

REGULAR ARMY RESERVE OF OFFICERS

Major-Gen J. W West, C.B., C M.G., C B.E, late R A.M.C, having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

Col. G. B. Edwards, D S.O, late R A M.C, having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

Royal Army Medical Corps

Lieut -Col. L F K Way, D S.O, has reverted to the rank of Major at his own request whilst employed during the present emergency

Capt (Temp Major) R. N Porritt to be Brevet Major under the provisions of Article 168, Royal Warrant for Pay and Promotion, 1940.

Capt and Brevet Major (temp. Major) L J Sheil, M C, having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

War Subs. Capt (Temp Major) J B. Lloyd, from temp commission, to be War Subs. Capt. and Temp. Major, retaining his present seniority.

TERRITORIAL ARMY, R A M.C

Lieut -Col. W C. Gunn, T D, having attained the age limit, has relinquished his commission and is granted the rank of Col

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

LONDON SATURDAY OCTOBER 31 1942

WARTIME INCREASE IN CAPITATION FEES

REFUSAL BY MINISTRY OF INSURANCE PRACTITIONERS' CLAIM

A special meeting of the Insurance Acts Committee was held on Oct. 22 to receive the reply of the Minister of Health to the arguments recently addressed to him by deputation for a wartime increase in the insurance capitation fee in view of the greatly increased work of insurance practitioners and the steeply rising costs. The Minister's reply, in a letter dated Oct. 17, was that, for reasons already set out in an earlier letter from the Secretary of the Ministry, he was not able to accede to the request. The Minister added that he had come to this conclusion with great reluctance as being the only one consonant with the general policy which the Government had adopted in the matter of increased remuneration during the war period, and he assured the Committee that the decision in no way prejudiced future discussions which his Department might have to enter into on wider matters affecting the medical profession.

Dr. E. A. Gregg, the chairman of the committee, who had led the deputation, said that the rejection of the practitioners' just claim would cause grave dissatisfaction throughout the profession. He noted that the Minister said nothing about the merits of the case put up on behalf of the profession, and indeed in all the correspondence which had previously taken place no suggestion was ever made by the Ministry that the claim was not well justified. The Minister took his stand on the impossibility, from his point of view, of going to Parliament for more money. The case for practitioners could not have been put to the Ministry more completely or more strongly than by the deputation on Sept. 22, and the Minister was fully apprised of the feelings of doctors over this matter.

The committee then discussed for more than two hours the form of recommendations which it should make to the Panel Conference to be held on Nov. 5. Every member of the committee present, representing all the regions of the country, including Scotland, contributed his observations. The meeting unanimously rejected any idea of accepting the Minister's refusal, under protest or otherwise, and various suggestions were made for future action. One member said that while any refusal of service was out of the question during the war, a purely wartime measure might be sought in the form of some variation of the terms of contract as from a fixed date so as to afford some reliefs to practitioners. National health insurance patients might be placed on much the same footing as members of Public Medical Services, and the giving of anaesthetics, attendance at miscarriages, and late and night visits might be subject to an extra fee; also a small charge might be made for all certificates issued for sickness benefit.

The likely public reaction to such a measure was discussed, and some objections were stated, as, for example, that by no means all insured persons were better off than before the war, and that the people who needed the services most might not be among those whom the war had made relatively prosperous. There was also a general distaste for any lowering of the standard of service, which has been so painstakingly built up by the profession (even without very much official encouragement), or any limitation of its scope. The plan, however, was not ruled out as an alternative to other measures.

Another proposal which found a good deal of favour was deferred payment in the form of post-war credits, but it was pointed out that this did not meet the immediate difficulty, which was that large numbers of practitioners needed money now to meet their present and increasing liabilities. A proposal that certain expenses of practitioners, as, for example, motor-car taxation, should be the subject of concessions (as it was in certain circumstances in the last war) was noted as a matter for separate representation, not related to the capitation fee. The proposal which found most favour, however, was to make a request for arbitration on the claim in the first instance. The committee by a very large majority, almost unanimously, decided to recommend to the Conference that a request for arbitration be made, but with certain alternatives in the event of the rejection of this request. The forthcoming Conference will have a full opportunity of debating the whole position.

War Damage Insurance.—Doctors should note in their own interests that the procedure of insurance companies acting for the Board of Trade and their agents for the issue of renewal notices under the Commodity, Businesses, and Private Chattels Schemes is not identical with that to which the public are accustomed under the companies' ordinary policies. The issue of notices is not obligatory, and not more than one notice will be sent. As that notice may go astray doctors should enter a precautionary note on their diaries of the date on which the insurance expires, because no liability attaches under a policy if a cheque is not received by the company within the days of grace allowed

Correspondence

The Absentee Doctor's Share

SIR,—I am an absentee practitioner who has closed his house and practice and left it to the care of the B.M.A. Protection of Practices Scheme, and I entirely concur with statements made by Dr. L. B. Liebster (*Supplement*, Sept. 26, p. 37). I would like to make the following suggestions, which could easily be incorporated in the scheme and would help to overcome two of its main difficulties.

(1) All permanent panel lists were closed in Sept., 1939, and all acceptances since then are classed as wartime acceptances. If a proportion of all these wartime capitation fees was deducted and in each area pooled for distribution equally among absentee practitioners, that would, in part, offset the disadvantage of the absentee. The figure I had in mind was 3d. per quarter per head. The amount could be adjusted to avoid any undue hardship and the matter could be dealt with by the local committee.

(2) The problem of the distribution of private fees for the absentee is much more difficult, and here again I think a general percentage scheme would be more practicable. The details would vary naturally with the area, the number of absentees, and their proportion of the number of acting practitioners. But if 1% per quarter of the total private fees per absentee, in a group of 20 was deducted then the absentee would receive 5% of the total of his private fees, which would be a fair share of the work he probably did. I am sure that the acting practitioners would rather do this than have the business of rendering accounts and details to the bureau. It would be much simpler and more satisfactory all round. I must add that where an absentee practitioner has either an assistant, locumtenent, or partner acting on his behalf for the purposes of the second of my suggestions he need not be counted as an absentee.

In view of the high level of taxation the cost of my schemes to the acting practitioner would be negligible, and the help to the absentee considerable. I think that the problem is an important one and the solutions workable.—I am, etc.,

DALTON Y. CARTER.

State Medical Service

SIR,—May I endorse most heartily the letter of Dr. W. B. J. Pemberton (*Supplement*, Oct. 17, p. 52) in which he pleads that the subject of State Medical Service may be given a well-earned rest. Everybody recognizes that the post-war period will bring many problems and difficulties, but have we not become a little unbalanced on the subject of planning? One set of enthusiasts apparently desires to demolish most of London and to replace it by what a correspondent in the

Daily Telegraph aptly describes as "a rectilinear city with miles of uniform buildings." Another set of enthusiasts seems to want to carry out a similar design in the medical profession. Now that we have all had our little outburst (most of which is really due to a minor degree of anxiety neurosis) how about forgetting it for a bit, and settling down to the real job in hand—namely, winning the war?—I am. etc.,

Hove. W. N. Maple.

Misuse of Term "Dermatitis"

Sir,—May I urge practitioners to avoid so far as possible on N.H.I. certificates the term "dermatitis"? I am quite sure that if they realized the trouble and consumption of paper that this causes they would confine its use to cases where it is strictly necessary, and we should no longer have patients with impetigo and a host of other conditions having a batch of forms sent them together with instructions to see an examining surgeon. To an approved society there is only one form of dermatitis, and that is industrial. If the term must be used and the condition is plainly non-industrial, the word "non-industrial" should be added. One frequently comes across cases where doubt as to liability results in unpardonable delay in settlement and injustice to the insured person. The 5s. fee, which often has to be paid quite unnecessarily for the examining surgeon's certificate, is an added irritant.—I am, etc.,

Birmingham. A. H. Driver.

It is proposed to publish a statement in next week's issue which, it is hoped, will explain matters

WEEKLY POSTGRADUATE DIARY

British Postgraduate Medical School, Ducane Road, W.—*Daily*, 10 a.m. to 4 p.m., Medical Clinics, Surgical Clinics and Operations, Obstetrics and Gynaecological Clinics and Operations *Daily*, 1 30 p.m., Post-mortems *Mon*, Course on War Medicine begins. *Tues*, 10 a.m Paediatric Clinic; 11 a.m., Gynaecological Clinic *Wed*, 11 30 a.m., Medical Conference; 2 p.m., Prevention of Communicable Diseases in the Army, Col. N H. Brown *Thurs.*, 2 p.m., Dermatological Clinic. *Fri.*, 12 15 p.m., Surgical Conference; 2 p.m., Gynaecological Conference 2 p.m., Sterility Clinic.

DIARY OF SOCIETIES & LECTURES

Royal College of Surgeons of England, Lincoln's Inn Fields, W.C.—*Wed.*, 3.15 p.m Robert Jones Memorial Lecture by Prof. Harry Platt: Congenital Dislocation of the Hip-joint.

Royal Society of Medicine.—*Tues.*, 4 p.m. General Meeting of Fellows. *Wed.*, 2 30 p.m Section of History of Medicine; 2 30 p.m Section of Surgery. *Fri.*, 10.30 a.m Section of Otology; 2 15 p.m. Section of Laryngology, 2 30 p.m Section of Anaesthetics.

Biochemical Society.—At Department of Organic Chemistry, Imperial College of Science and Technology, South Kensington, S.W., *Sat.* (Nov 7), 11 a.m. Communications

Royal Society of Tropical Medicine and Hygiene.—At 26, Portland Place, W. 4 p.m Paper by Col. N. Hamilton Fairley, F.R.S., A.A.M.C., and Col J. S. K. Boyd, A.M.S.: Bacillary Dysentery and its Modern Treatment with Special Reference to Sulphaguanidine. To be read by Col Fairley.

B.M.A.: Branch and Division Meetings to be held

City Division.—At Metropolitan Hospital, Kingsland Road, E., Oct 31, 2 30 p.m. General Meeting. Report of Representatives at A.R.M., etc.

North of England Branch.—Joint meeting with Newcastle-upon-Tyne and Northern Counties Medical Society at Royal Victoria Infirmary, Newcastle-upon-Tyne, Thurs., Nov. 5, 2.15 p.m. Clinical demonstration: 3.45 p.m Brig. F. A. E. Crew: Contribution of Genetics to Medicine. All members of H.M. Forces stationed in area are invited to attend.

APPOINTMENTS

Langley, G. F., Ch.M., F.R.C.S., Honorary Assistant Surgeon, East Suffolk and Ipswich Hospital.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue

DEATH

Moyes.—On Oct. 23, 1942, Robert Esmond Moyes, M.D.Ed., of Broomhill and Warkworth, Northumberland

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY NOVEMBER 7 1942

PLANNING COMMISSION'S REPORT

A DIAGNOSTIC RADIOLOGIST'S OPINION

BY

J. V. SPARKS, M.R.C.S., D.M.R.E.

The frank discussion of the possible alterations in medical practice after the war prompts me to put forward the individual opinion of a diagnostic radiologist. As the development and technical advances of radiology are to a large extent responsible for many of the problems so ably outlined in the report of the Medical Planning Commission, I have no doubt that a number of radiologists will be found willing to co-operate in any scheme which would provide an improved radiological service for the community, provided it helped also to advance the science of radiology and was acceptable to the remainder of the profession, including those at present in the Forces.

Limitations in Existing Services

The medical practitioner would be the first to agree that an *x*-ray examination is not only desirable but, in the large majority of cases, essential to verify a suspected clinical lesion and, in many instances, to exclude disease. To-day such facilities are not so readily available as envisaged in the new proposals. An impartial observer before the war would envy our methods of training technicians and teaching radiologists, but would be amazed at the unsuitable sites and space allotted to departments of radiology and the obsolescent apparatus with which many of them were equipped. Such faults may not have been due so much to lack of vision as to shortage of funds and space and to priority claims for new accommodation, for it may not yet have been realized to what extent diagnosis depends on radiographic interpretation. No closer analogy could be quoted than that of the danger, impotence, and limitations of our Forces on land or at sea without adequate air protection. Radiology has truly altered the practice of medicine and surgery, nor do we lack the reconnaissance and bombing forces which may achieve results in areas or diseases beyond the present-day reach of the physician or surgeon.

The adequacy of radiological services to-day may be estimated by comparing the results of clinical and pathological observations and operative and post-mortem findings with the *x*-ray findings, and such a follow-up will show whether any shortcomings are the result of radiological technique or observation. Fifty years have not yet elapsed since the discovery of the Roentgen ray. Startling as are the advances achieved to date, it is idle to deny that we may have as yet made only a creditable beginning. Any scheme that restricted expenditure on development and research or limited the free choice of apparatus would be a calamity for the future of radiology in this country.

Minimum Requirements of Small Department

Now it is possible that the first *x*-ray examination demanded by the patient's doctor is a most important step to guide him and the patient in the correct channel for subsequent advice and treatment. In the proposals for a Medical Health Centre provision has been made for "a small *x*-ray department." This wording, which may be misleading, suggests to me either (1) that the department would be small, or (2) that it would be equipped with apparatus of small power.

(1) When discussing an ideal it is tempting to put forward more grandiose ideas than may be found to be practicable. I therefore submit the minimum requirements of a small *x*-ray department to be a reception hall, dressing-rooms (including one for a sick patient), an *x*-ray room, a dark room, a viewing or consultation room, a filing room, and an adjacent sluice and lavatory. To what extent such rooms could be merged would depend on their size and on the inconvenience to be suffered in a busy department as a result of such mergence. The capacity of one *x*-ray room is limited and would vary considerably with the type of examination and the speed of the technician; it might be estimated at 5,000 patients a year, and if gastro-intestinal cases were examined daily this capacity would be reduced, and would necessitate the provision of an additional fluoroscopic room. The capacity would also be reduced by including such routine examinations as the setting of fractures, removal of foreign bodies, pyelography, and other cases in which contrast media must be employed. Provision should be made for such capacity to increase yearly by 100% for several years to come.

(2) One of the chief deficiencies of radiological services to-day is the limitations of the *x*-ray machine of small power. While the opinion of radiologists may be divided, and while certain kinds of examination are well suited to this type of plant, I consider it is fair to state that such a machine is less likely to permit accurate interpretation in subjects of heavy build, in lesions of the urinary tract, gall-bladder, chest, and alimentary tract, and in ante-natal work. While it may be argued that these cases are not intended to be investigated in a Health Centre, it is unlikely that this will be heeded in practice, and a journey of 5, 10, 25, or 50 miles would mean a serious limitation of this service for many patients and practitioners. Again, it might be argued that the small-powered plant might give sufficient indication of the need for a further examination, but this might not be true for those cases where the initial findings were negative or presumed to be normal. Many examples could be cited of the dangers of an inadequate or incomplete initial *x*-ray examination.

Terms and Scope of Future Services

It is not my intention to discuss at any length the remuneration of radiologists except to suggest that it would be unethical for a hospital or the State to receive a fee from a patient for any radiological service rendered without transmitting a portion to the radiologist, whether he be employed whole-time or part-time. Neither should such service be included in the "cost of hospital benefit" or "insurance provision of a provident character" without recognized payment.

It seems, however, that some provision must be made to permit the remaining 5% to 10% of the population (however fallacious that figure may prove to be) to be examined in the State centres should they so desire, and, in areas where no radiologist practised in private, this would appear to be the only means of having an *x*-ray examination carried out locally. Facilities must therefore be provided not only to meet such eventualities but also for paying patients attending the larger centres and admitted to their private wards.

It is not necessary for me to enlarge on the part which miniature mass radiography is destined to play in the future in industrial health. This is now being rapidly expanded in the Navy, Army, and Air Force, and will within a few months be available for the examination of the civil population (as recently announced by the Minister of Health); it will provide a new means of detecting chest disease and possibly at an earlier stage. These examinations, which will be repeated at intervals, will be carried out at different centres or in departments separate from those used for other routine *x*-ray examinations.

I cannot conclude without referring to the large increase in the number of radiologists which will be required to undertake the radiological work in the proposed scheme, and it is to be hoped that the Government will take the present opportunity of continuing and extending their scheme of training radiologists for this essential service.

PETROL FOR DOCTORS

The Secretary of the B.M.A. has been informed by the Petroleum Department that doctors will not be called upon to sustain a cut in their petrol allowances for the November-December-January period. The question of petrol for attendance at medical meetings of various kinds is being reconsidered by the Department, and it is hoped to publish a further statement shortly on this subject.

Correspondence

National Eye Service

SIR,—We who are serving under present intolerable conditions are again to be asked to consider a reasonable uniform rate per case as against a two-scale rate (not a sliding scale). It has been and is a recognized principle of medical practice that for the same service a smaller fee may be asked from the less-well-off members of the community. That is all that is being asked for by those who think a two-scale rate the better proposition. We do not ask the societies to institute any means test in their allocations, nor do we dictate what we think such allocations need be. But we do retain the right to refuse our charity to such as are able to pay us at an economic rate.

Though this principle may seem to have been traversed by the N.H.I. Acts, this is not so, as under these Acts there is only one level rate of contribution—taking into account certain differences due to age and sex—and total remuneration is fixed on the basis thereof and on a known number of beneficiaries. For the National Eye Service benefits there is no rate of contribution whatever, and no known number of beneficiaries, hence we are not bound by any N.H.I. precedents. Nor are we instituting a means test, for in that the amount of benefit given—e.g., pensions—varies according to the means. We are to give the same benefit to all beneficiaries, irrespective of their means.

Let the societies therefore allocate their varied benefits as they may determine, the beneficiaries paying the difference, if any, as many do now. With a standard National Eye Service fee of 21s., reduced to 10s. 6d. for all who sign a declaration, as has been done, that their income is below £250, we shall feel that our charity is not being exploited, and we shall continue to give, as we have done, "of our best to the worst"—a not inapt definition of hospital services.—I am, etc.,

Nottingham. A. CHRISTIE REID.

SIR,—In the *Supplement* of Oct. 17 (p. 49) I read that a motion at the Annual Representative Meeting by Plymouth that "the National Eye Service should be limited to persons with an income of £250 or less" was referred to the Council. In the *Supplement* of Oct. 24 (p. 53) there is more news of the National Eye Service, which makes it clear that somebody is determined to bring in people of a higher income limit, and, moreover, that the fee payable will not even be the 15s. 6d. which was at one time suggested. I do hope the Council will stand firm and refuse to be either coerced or jockeyed by the approved societies, and that they will see that the only possible action to take at present is to adopt the Plymouth resolution and instruct the Ophthalmic Group Committee accordingly.

A fee of 10s. 6d. for a careful examination of a patient by a competent oculist is quite inadequate, and could only be accepted on the basis that it is a great concession to the less-well-to-do members of society, and 12s. 6d. or 15s. 6d. to people with £8 a week is stretching charity too far. Because N.H.I. doctors have been forced to accept a new class on their panels is no good reason for foisting them on oculists at cut rates without even the certainty of getting regular payments whether service is given or not. If the approved societies must come into the picture it would be quite simple for them to issue a voucher value 10s. 6d. and allow their members to make their own arrangements.

Mr. Bishop Harman's letter (*Supplement*, Oct. 24), in which he appeals for thought for the future, is a very strong argument for doing nothing at present which will fix the fees for a specialist or consultant at a ridiculously low figure. How do our colleagues the physicians, surgeons, radiologists, etc., fancy the idea of their consultation fees being reduced to 10s. 6d. or 12s. 6d.? I know that the dispensing opticians, who are partners in the N.O.T.B., are making their plans for the future, and they envisage a time when their turnover will be doubled or trebled by a National Eye Service which will cater for everybody, and when they will be able to run the oculists in a really business-like manner.

I have no great personal and financial interest in this question, as I am coming to the sere and yellow leaf, but I do hate to think of what the future of ophthalmology may be and of the poor young oculists who will find the ground cut away from them when they come home from the war.—I am, etc.,

Plymouth CECIL B. F. TIVY.

H.M. Forces Appointments

ARMY

Major G. W. G Hughes, D.S.O., R.A.M.C., ret., has been restored to the rank of Lieut.-Col. on ceasing to be re-employed.

ROYAL ARMY MEDICAL CORPS

Lieut.-Col. (Temp. Col.) N. Cameron, having attained the age for retirement, is retained on the Active List, supernumerary to the establishment.

Major (Temp. Lieut.-Col.) J. A. Crawford to be Lieut.-Col.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

War Subs. Capt. C. W. Simpson, M.C., has ceased to belong to the Reserve of Officers on account of ill-health, and is granted the rank of Major.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Capt. J. I. Maran has relinquished his commission on account of ill-health and is granted the rank of Capt.

War Subs. Capt. R. M. Wyllie has resigned his commission.

Capt. A. H. Bean, from W.A.A.M.C., to be Lieut.

Lieuts. A. Dick, B. W. Smith, and T. de L. Walker have relinquished their commissions on acount of ill-health and retain their rank.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

The following M.O.s have been granted commissions in the rank of Lieut.: Beatrice L. H. Sergeant, Marie J. McCullagh, Monica H. Niblock, Margaret E. R. Balfour, Margaret Bennett, Margaret D. Hird, Aurora M. L. Isabella, Maria D. Kelleher, Mary E. Larg, Margherita M. Lilley, Marjorie B. Curties, Phoebe N. Harvey, Flora M. Henderson, Frances A. Hepburn, Lilian Hutchinson, Jean E. W. Inglis, Anne E. E. Jordon, Anne W. MacLennan, Madeleine B. Morris, Ena McA. Morrison, Ivy Nicholls, Ann L. Pinson, Beatrice M. Thompson, Hilda Walker, Edith H. Williams.

ROYAL AIR FORCE VOLUNTEER RESERVE

To be Fl. Lieuts. (Emergency): J. M. Barkla and H. L. Duncan.

Flying Officers A. G. Beattie, A. T. Hawthorne, H. Zinober, and T. J. Gordon to be War Subs. Fl. Lieuts.

To be Flying Officers (Emergency): W. G. Alexander, P. H. Beales, B. S. Good, K. W. Horn, A. F. Lang, M. Lees, G. Paterson, F. F. Shore, J. H. Spence.

INDIAN MEDICAL SERVICE

Major J. H. Boultbee has retired on account of ill-health.

B.M.A.: Meetings of Branches and Divisions

NORTHERN IRELAND BRANCH

At the annual general meeting of the Northern Ireland Branch, held at Belfast with Dr. F. P. MONTGOMERY in the chair, the report of council and the statement of accounts by the honorary treasurer were received and adopted unanimously.

The following officers for 1942-3 were elected: *President*, Dr. R. J. Spence. *Vice President*, Mr. C. J. A. Woodside. *President-elect*, Mr. R. J. McConnell. *Honorary Treasurer*, Dr. W. Lyle. *Honorary Secretary*, Dr. F. F. Kane.

On the motion of Dr. S. B. B. CAMPBELL, seconded by Dr. LYLE, the following motion was unanimously approved; and the secretary was directed to forward a copy to each medical member of the Northern Ireland Parliament and to the Ministry of Labour: "That the Northern Ireland Branch of the British Medical Association views with great concern the number of practitioners qualified since 1938 admitted to the National Health Insurance Practitioners List, and consider this is prejudicial to the interests of practitioners on active service in the armed Forces."

Members and visitors from the U.S.A. Army Medical Corps and R.A.M.C. subsequently had lunch in the Grand Central Hotel as guests of the president. There were 79 present. Dr. G. G. LYTTLE proposed, and Mr. H. STEVENSON seconded, a vote of thanks to Dr. MONTGOMERY, who replied expressing the pleasure of the Branch at the presence of so many Service guests. Col. E. C. BRENN. U.S.A., replied.

B.M.A.: Branch and Division Meetings to be held

GLASGOW AND WEST OF SCOTLAND BRANCH.—At Institution of Engineers and Shipbuilders in Scotland, 39, Elmbank Crescent, Glasgow, Tues., Nov. 10, 3.30 p.m. Prof. J. M. Mackintosh: The Background of Preventive Medicine.

NORTH OF ENGLAND BRANCH.—Joint meeting with Newcastle-upon-Tyne and Northern Counties Medical Society at Royal Victoria Infirmary, Newcastle-upon-Tyne, Thurs., Nov. 12, 2.15 p.m. Demonstration; 3.45 p.m. Prof. J. Le F. Burrow: Problems of Minor Medical Illness: Diagnosis and Treatment. All members of H.M. Forces stationed in the area are invited to attend.

DIARY OF SOCIETIES & LECTURES

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—*Thurs.*, 3.15 p.m. Bradshaw Lecture by Mr. L. R. Braithwaite: The Role of Bile in Duodenal Regurgitation.

ROYAL SOCIETY OF MEDICINE.—*Tues.*, 2.30 p.m. Section of Psychiatry; 2.30 p.m. Section of Therapeutics and Pharmacology. *Fri.*, 2.15 p.m. Clinical Section; 2.30 p.m. Section of Ophthalmology.

CHADWICK TRUST.—At London School of Hygiene, Keppel Street, W.C., *Tues.*, 2.30 p.m. Miss Jocelyn Adburgham: Land Settlement—Its Sanitary and Architectural Aspects and After-war Possibilities.

ROYAL NATIONAL THROAT, NOSE AND EAR HOSPITAL, Gray's Inn Road, W.C.—*Fri.*, 4 p.m. Mr. A. R. Dingley. Symptoms and Treatment of Frontal Sinusitis.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.

BIRTH

BROWN.—On Oct. 26, 1942, to Betty (*née* Matthews), wife of Capt. Alex L. Brown, R.A.M.C., M.E.F., a daughter.

Mr. Noel Waterfield, F.R.C.S., has been elected chairman of the Surrey Insurance Committee, the second medical man to occupy that position since the committee was formed.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY NOVEMBER 14 1942

RECRUITMENT OF DOCTORS FROM NORTHERN IRELAND

Compulsory recruitment to the Services does not apply in Northern Ireland, but notwithstanding this fact the number of practitioners supplied to the Services from Northern Ireland compares most favourably with the number from England, Scotland, and Wales. Not only has Northern Ireland supplied on a voluntary basis its quota of general practitioners and specialists, but it has also contributed a large number of practitioners from its young practitioner pool.

Appeals are sent to Northern Ireland from the Central Medical War Committee from time to time, and these appeals never go unanswered. Although this is only what is to be expected from colleagues in Northern Ireland, tribute should be paid to their loyal and voluntary offers of service to the Central Medical War Committee ever since the outbreak of the war. A special word of thanks is due to the secretary of the committee, Dr. F. M. B. Allen.

PATIENTS ATTENDED UNDER THE E.M.S. SCHEME

Below is a statement by the Ministry of Health regarding the type of patients dealt with under the Emergency Medical Service scheme. This answers a question which some practitioners have been asking.

"Although designed primarily for air-raid casualties, the scheme made provision from the outset for such Service sick and casualties as could not be conveniently accommodated in Service hospitals, and for civil defence personnel injured on duty, together with civilian patients who had to be transferred from hospitals in the inner parts of large towns to outer hospitals because of the reduction of facilities at the inner hospitals, and unaccompanied evacuated children.

"When it appeared that air-raid casualties would not come up to expectations, much of the accommodation which had been drastically cleared of patients and reserved at the onset of the emergency was at once released for normal hospital purposes, and the organization of the scheme came to be utilized for various new types of war needs, namely: (1) Evacuees. Apart from the unaccompanied child, the scheme was extended to all those coming under any Government evacuation scheme, and later to all unofficial evacuees who made their own arrangements for temporary residence away from evacuation areas owing to the war. (2) War workers transferred from their homes to other areas and living in billets or lodgings. (3) Merchant seamen requiring hospital treatment away from home or injured on duty. (4) Fracture cases among war workers anywhere, whether transferred or in their home areas. (5) Civil defence whole-time workers transferred away from their home areas—whether for war service injury or not. (6) Women's Land Army, Home Guard, Air Training Cadets, and other miscellaneous groups

"In the result air-raid casualties now form only a small proportion of the patients provided for under the scheme, and most of the day-to-day work is unaffected by the absence of air raids."

FIRE PREVENTION DUTIES

Standard of Fitness

For the guidance of all concerned the Ministry of Home Security has defined fire prevention duties. It has also devised a form of certificate for use by the medical referees appointed by the Ministry of Labour and National Service. The essential details are given here for the information of doctors generally.

Fire prevention duties are defined as the duty of (*a*) keeping a watch for the fall of incendiary bombs and for any outbreak of fire occurring as a result of hostile attack; (*b*) taking such steps as are immediately practicable to combat such a fire; (*c*) summoning such assistance as may be necessary; (*d*) being in readiness to perform any of the above duties. To combat such a fire a team of three persons is normally required, one of whom works a stirrup pump, another carries water to the pumper and acts as a relief pumper when required, and the third holds the nozzle of the hose of the stirrup pump and directs water from the nozzle towards the fire. Fires caused by incendiary attack usually occur on the upper floor of a building and sometimes in the roof and roof spaces.

The operations of working a stirrup pump, carrying water, and climbing stairs are those which the vast majority of persons who undertake fire prevention duties would be required to perform, and the standard as regards these items would be the same for men and women. In a relatively small proportion of instances persons may be asked to operate trailer pumps, to climb ladders, or to clamber over roofs; but for these more arduous activities volunteers from among the persons on duty are normally used. It is, of course, difficult to fix a standard, but if the normal standard were that required for the most arduous activities the result might be that very large numbers of persons who were fully capable of all fire prevention duties normally required of stirrup pump teams would be totally exempted from these duties.

The certificate to be used by medical referees is as follows:

I have to-day examined ....
and I hereby certify that in my opinion he/she is suffering from ....
....
that he/she
has/has not fair sight;
has/has not fair hearing;
is fit/unfit to work a stirrup pump;
is fit/unfit to carry a bucket of water for 25 yards on level ground;
is fit/unfit to climb two flights of stairs at a reasonable pace without distress;
and should be re-examined in..........months.

The standards indicated in this certificate should be borne in mind by doctors generally when they are asked to certify unfitness for fire prevention duties.

LAID-UP CARS

The B.M.A. has represented to the Ministry of War Transport the special claims of doctors in connexion with the proposed requisitioning of cars and tyres. In particular, the position of doctors in the Forces whose cars are temporarily laid-up and of doctors in civil practice who keep a spare car for use in emergencies has been explained. The matter is being examined by the authorities concerned, and all that can be stated at present is that when the requisitioning of private cars becomes necessary, consideration will be given to laid-up cars in the hands of members of the medical profession. A fuller statement will be published as soon as possible.

Correspondence

State Medical Service

SIR,—I deplore most earnestly the attitudes of Dr. W. B. J. Pemberton (*Supplement*, Oct. 17, p. 52) and Dr. W. N. Maple (*Supplement*, Oct. 31, p. 55) that the subject of State Medical Service be given a well-deserved rest. Are they content to sit back while the Ministry foists some fantastic bureaucratic scheme of medical service on to the medical profession and the public? It is this state of apathetic indifference evinced by the medical profession in general that permits the Ministry to take an unremitting advantage whenever it is convenient to do so. Indifference is an indefensible manner to assume and gives the Ministry greater scope to use its power, which is infinitely more authoritative during stress of war.

Already we have been told that the medical services of the country are so rotten that drastic changes have to be made. This is paradoxical when one knows that the health of the community has improved vastly during the past 20 years. Any ill-health or deficiencies in medical services that exist are mainly due to economic conditions, sanitation, housing, etc., and these are the direct concern of the Ministry, the public health officials, and the school medical service, and are not within the scope of the medical profession as a whole. This is corroborated by the fact that, since the beginning of this war, tuberculosis and contagious diseases have shown a disturbing increase.

One must whole-heartedly agree with Drs. Pemberton and Maple that the real job at the moment is winning this war, but, surely, meetings and discussions among the profession are not going to interfere with that. One must not forget that we are fighting for democracy.—I am, etc.,

Halifax. DONALD G. S. MACKAY.

Future of Medical Practice

SIR,—One wonders if some of your correspondents are aware of the implications of the recommendations of the Medical Planning Commission, the Insurance Acts Committee, and the Annual

Representative Meeting. These recommendations, it seems, can be summarized simply: (1) rejection of a full-time salaried medical service; (2) the extension to the dependants of insured patients of all the benefits of the National Health Insurance scheme. The adoption of the latter would, I am informed, bring 90% of the population within its scope. This means the end of private practice.

It would seem, then, that we should have a State service with all the disadvantages of the *ad hoc* scheme and none of its advantages—viz., an assured income and compensation for present-day practice values. Much though many of us dislike all that a full-time State service implies, it would seem preferable to the other. It is again the question of whether a bird in the hand is worth two in the bush. One looks to you, Sir, for a lead in such matters. Is this not the time to make the situation clear, not to the profession alone but to the Government? Memories are short, and so one may perhaps be permitted to remind your readers that despite the fact that the profession turned down the original National Health Insurance terms of service, nevertheless they became law. Recent correspondence with the Ministry, as reported in your columns, does not suggest that matters will be any different when the new terms of service are considered unless we act now.—I am, etc.,

Highgate, N.6 W. LEES TEMPLETON.

BRITISH MEDICAL ASSOCIATION

FORMATION OF NORTH BEDFORDSHIRE AND SOUTH BEDFORDSHIRE DIVISIONS

Notice is hereby given by the Council that from the date of this notice the Bedfordshire Branch will consist of two Divisions, whose designations and areas are as follows:

North Bedfordshire: Municipal Borough of Bedford; Urban Districts of Ampthill, Biggleswade, Kempston, and Sandy; Rural Districts of Ampthill, Bedford, and Biggleswade.

South Bedfordshire: Municipal Boroughs of Dunstable and Luton; Urban District of Leighton Buzzard; Rural District of Luton.

G. C. ANDERSON,
Nov. 6, 1942. *Secretary.*

Meetings of Branches and Divisions

NORTHERN IRELAND BRANCH: NORTH-EAST ULSTER DIVISION

A meeting of the North-East Ulster Division was held at Garvagh with Dr. T. ADAMS in the chair. Dr. F. P. Montgomery, president of the Branch, Dr. F. M. B. Allen, and other members from Belfast were also present. The interim report of the Medical Planning Commission was discussed, and it was agreed that the best form of medical service for the nation after the war would be a very liberal extension of the present panel system as set out in the report. The meeting was very decidedly against a complete State Medical Service. Dr. J. C. LYLE emphasized that the pensions of dispensary doctors must be safeguarded in any future medical service.

Branch and Division Meetings to be Held

NORTH OF ENGLAND BRANCH.—Joint meeting with Newcastle-upon-Tyne and Northern Counties Medical Society at Royal Victoria Infirmary, Newcastle-upon-Tyne, Thurs., Nov. 19, 7.15 p.m. Clinical demonstration: 8.45 p.m. Prof. F. C. Pybus: Recent Advances in Cancer Research. All members of H.M. Forces stationed in the area are invited to attend.

WESTMINSTER AND HOLBORN DIVISION.—At Westminster City Hall, Charing Cross Road, W.C. Thurs., Nov. 19, 8.15 p.m. Lieut. D. Moyer, U.S.A.M.C.: General Practice in America. All practitioners in area of Division are invited to attend.

H.M. Forces Appointments

ROYAL NAVY

Surg. Lieut. B. Ridgway to be Surg. Lieut.-Cmdr.

ROYAL NAVAL VOLUNTEER RESERVE

Acting Surg. Lieut.-Cmdr. J. L. M. Wood to be Surg. Lieut.-Cmdr.

Prob. Temp. Surg. Lieuts. I. D. Leitch, A. M. Barnett, T. G. Paxon, A. B. Kennedy, J. P. Dewsbery, C. C. Evans, W. J. C. Markby, H. H. Nixon, J. E. Cursley, and A. R. Wear to be Temp. Surg. Lieuts.

ARMY

Col. F. R. B. Skrimshire, late R.A.M.C., having completed 4 years in the rank, is retained on the Active List supernumerary to the establishment.

Lieut.-Col. (temp. Col.) R. H. Alexander, M.C., from R.A.M.C., to be Col.

ROYAL ARMY MEDICAL CORPS

Major (War Subs. Lieut.-Col.) (temp. Col.) G. T. Garraway to be Lieut.-Col.

TERRITORIAL ARMY, R.A.M.C.

War Subs. Capt. G. C. Babington, from half-pay list, to be restored to full pay, retaining his present seniority.

Supern. for Service with Birmingham Univ. Senior Training Corps (Med. Unit).—H. P. Gilding to be Lieut.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Capt. J. M. Lawrie has been placed on the half-pay list on account of ill-health.

War Subs. Capts. G. R. Anderson and F. K. B. Quanbrough have relinquished their commissions on account of ill-health and are granted the rank of Capt.

Lieuts. N. Levy and A. R. V. Patel have relinquished their commissions on account of ill-health and retain their rank.

To be Lieuts.: T. T. Ferguson, P. B. De Mare, H. E. Thackray, R. T. Campbell, E. R. L. Gregson, H. D. McCall, J. de Swiet, J. Anderson, N. S. Barnett, A. C. Barthels, W. M. Burgess, V. C. Benson, N. P. Bruce, S. R. M. Bushby, B. S. Cardell, R. Y. Carter, M. Caturani, H. D. Cockburn, D. C. Coull, J. W. A. Crabtree, J. Craig, D. H. Cutler, H. L. De Waal, J. O. W. Dick, I. G. B. Drybrough-Smith, B. L. Eames, B. K. Ellenbogen, A. W. G. Elliott, A. Elliot Smith, M. M. A. El Mishad, D. R. Evans, W. Forster, B. Gaunt, C. J. Glass, J. L. T. Graham, D. Granet, H. Grenville, J. E. H. Griffiths, R. B. Halford, M. Hall, W. H. Harris, J. H. Hilditch, J. B. Jayne, W. Johnson, S. R. Kaye, M. J. Keating, G. Kelham, B. Kelion, T. Kramer, G. L. Lambert, J. C. Leask, H. Lipman, D. C. Little, C. J. Livingstone, K. G. Lowe, B. S. Lush, R. MacG. McGowan, W. McKellar, J. H. MacLaughlin, D. H. Mackay, J. S. Mackay, P. L. F. Mortimer, S. W. K. Norris, E. R. Nurse, J. T. J. O'Reilly, R. F. G. Ormrod, G. E. Parker, H. C. Percy-Hughes, R. J. F. H. Pinsent, I. D. Riley, J. S. Rix, M. Rosten, J. O. Schofield, D. R. Seaton, J. Slorach, J. R. Smith, L. Smulian, G. O. Storey, D. A. Vyrnwy-Jones, R. H. Watson.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

War Subs. Capt. M. J. Thornton has relinquished her commission.

DEATHS

PRICE.—On Nov. 3, 1942, after a long illness, Lawrence Edwin Price, M.R.C.S., L.R.C.P., aged 63 years, dearly loved husband of Mary (*née* Hooson), late of "Red Roofs," Nuneaton, and of "Greenways," Crabbs Park, Paignton. Mayor of Nuneaton 1928-1930.

MARTIN.—On November 1, at Bath, Somerset, H. Meredith Martin, F.R.C.S., following a short illness.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY NOVEMBER 21 1942

ANNUAL PANEL CONFERENCE

CLAIM FOR WARTIME INCREASE IN REMUNERATION

ACTION ON MINISTER'S REFUSAL

The Annual Conference of Representatives of Local Medical and Panel Committees was held in the Great Hall of the British Medical Association House in London on Thursday, November 12. Almost every insurance area in Great Britain was represented, and the attendance numbered nearly 200. The chair was taken by Dr. D. G. Greenfield, who was supported by Dr. E. A. Gregg, chairman of the Insurance Acts Committee.

Tribute was paid at the beginning of the Conference to the memory of Sir Henry Brackenbury and Dr. E. R. Fothergill, who had given so many years of conspicuous service to insurance practitioners, and to two members of the Insurance Acts Committee who had died during the year, Dr. R. Boyd and Dr. J. C. Davies.

On a motion by the representative of Bristol, the following resolution was unanimously carried:

> "That this Conference, representing all insurance practitioners in Great Britain, sends a congratulatory message to the Director of Medical Services, 8th Army, expressing profound admiration at the part played by the medical services in the Battle of Egypt and wishing him and the officers and men serving under him good fortune and continued prosperity in the future."

An alteration of standing orders to admit of the election of 6 additional members of the Insurance Acts Committee by the general body of representatives was agreed to. Dr. Gregg mentioned that with these additions the committee would number 47 members, of whom 44 would be general practitioners. This election of six members took place in the course of the Conference. The following were chosen: Dr. A. Beauchamp (Birmingham), Dr. Elkington (Shropshire), Dr. D. G. Greenfield (Northamptonshire), Dr. I. G. Innes (Hull), Dr. J. A. Pridham (Dorset), and Dr. F. M. Rose (Preston). A contested election for the chairmanship of the Conference resulted in the return of Dr. J. A. Brown (Birmingham).

"Grave Dissatisfaction"

Dr. Gregg next moved, on behalf of the Insurance Acts Committee, the first of several motions regarding the position which has arisen on the Minister's rejection of the claim of insurance practitioners for a wartime increase in their remuneration. He reminded the Conference that on the last occasion on which it met it was faced with the offer of the Minister of an additional ninepence to cover increased practice expenses. Discussions had continued since then. Just before the war some useful statistics had been collected regarding the services rendered by insurance practitioners, and good use would have been made of these had the war not broken out. It presently became evident, however, that a strong case could be made out for a wartime increase on two other grounds—namely, the increased cost of living and the increased obligations to which practitioners were subject consequent upon enlargement of insurance risk. As a result of the war a very large number of healthy lives had been withdrawn from their insurance lists; some of them had returned, but not as healthy lives, having been broken and disabled by war. In addition there had been admitted to insurance large numbers of women and middle-aged men, many of them not hitherto engaged in insurable employment, who were now undertaking unaccustomed work in conditions for which many of them were not properly equipped, and their health reflected the character of the burden they were carrying.

These and many other facts had been pointed out to the Minister. It was explained to him that the medical profession was doing something for its members on service such as no other section of the community was doing. In Government and local government circles and in large businesses and approved societies the remuneration of those who had gone into the Services was made up to the level of what they had been receiving in civil life. But the medical profession, through the operation of the Protection of Practices Scheme, had voluntarily arranged that the absent doctor should receive 50% of the remuneration which he would receive from his practice if he were at home. The profession had received no help from anybody; it was doing it by itself and was proud and glad to do it. But if moneys from the Central Insurance Fund were being used on the approved society side for the purpose of raising incomes to those received in civil employment, it seemed reasonable to include what doctors were doing among the other items in the case.

Dr. Gregg went on to describe the way in which the committee's representations had been received by the Ministry. After receiving an unfavourable reply from the Secretary to the Ministry, Sir John Maude, a deputation from the committee waited on the Minister himself, and a verbatim report of the interview was in the hands of representatives. He reiterated the arguments which were placed before the Minister. He himself had had an idea that the present Minister of Health was more favourably disposed towards the position of insurance practitioners than his predecessors, and this seemed to be borne out by the delay which ensued before his reply was received—a delay which incidentally caused a postponement of the Conference to a later date than the one originally fixed. It was evident that the Minister consulted his colleagues, but the reply when it came was a reluctant refusal. The reply was one which would cause general dissatisfaction and confirm the feeling of resentment and frustration which those representing insurance practitioners had felt in their relations with the Ministry. "We have not finished with this yet, and we have no intention of being finished with it. (Applause.) We mean to pursue it in such ways as we can. We may have to pause, but if we pause it will only be to go forward again in the way that opportunity shapes." He moved:

> "That this Conference of Local Medical and Panel Committees is gravely dissatisfied with the Minister's rejection of the just claim of insurance practitioners for a wartime increase in remuneration."

Publicity

It was moved at this stage by Dr. A Owen (Lancashire) that in view of the serious nature of the Conference discussions the lay Press be excluded. This was supported by Dr. J. P. Quinn, another Lancashire representative. Dr A. Beauchamp (Birmingham) said that this was a retrograde step. There were grumbles among practitioners that not enough publicity was given to their case, that they did not have sufficient "press." The motion to exclude the Press was decisively rejected.

Dr. G. de Swiet (London) said that it was well known that civil servants and school teachers and others had had increases sanctioned by the Government. According to the interview which the deputation had with him, the Minister was concerned about the vicious spiral. but that spiral received its initial impetus from the action of the Government itself in instituting various increases in prices over which it had control.

A Plea for Further Waiting

Dr. N. Stevens (West Suffolk) moved an amendment in which the Minister's rejection of the claim for a war bonus was noted and the Insurance Acts Committee was instructed to renew its claim to a cost-of-living increase if and when such increase was given to comparable sections of the community. The mover agreed that the capitation fee was inadequate, and that the Minister had treated them badly. But the Conference had agreed last year to let this matter rest until after the war, when the whole question of the capitation fee would be explored. He considered it doubtful whether they had any right to a war increase at all, but there was no excuse for going back on the resolution of last year. A sense of patriotism should make them content with some lower scale of living. It was true that there were some areas where a war bonus was urgently needed, such as the eastern and south-eastern district, where practitioners had suffered badly through the departure of their patients following upon raids, but to grant a war increase over the whole country would be inequitable because it would benefit practitioners who in reception and munition areas had benefited already. It was most unbecoming for doctors to keep up this cry, and their attitude was playing into the hands of those who sought to turn them into a State Medical Service.

Dr. H. B. Pollard (Bedfordshire) spoke to the same effect. Like the rest of them, he was dissatisfied with the capitation fee, but he felt that at this time they ought not to be fighting for another sixpence or shilling. Dr. C. M. Stevenson (Cambridgeshire) said that that was also the feeling in his committee.

Counter-arguments

Dr. J. A. Brown (Birmingham) supported Dr. Gregg's resolution. They had asked the Minister for an increased premium to cover an increased risk. He endorsed what Dr. Gregg had said about the removal of healthy insured persons and the substitution of older people, many of them in indifferent health, who were being subjected to long hours and considerable strain.

Dr. A. S. Winstanley (Lancashire) said that national health insurance practice had never at any time been a sound business proposition except in so far as it had been subsidized by private practice and private fees of various sorts. This subsidy varied considerably according to the area of the practice, but even in an industrial area where private practice consisted almost entirely of the treatment of dependants and others of like economic status it had not been inconsiderable. But the value of the subsidy was disappearing owing to the inroads made by Government and local government services and by the inclusion of new groups of persons in insurance. He did not believe that they would incur the opprobrium of the public if they went further with their demands. The public must be made to understand the significance of the insurance practitioner's remuneration. Three or four years ago it was worked out that the capitation fee was equivalent to 2s. 3d. for a visit and 1s. 7½d. for an attendance.

Dr. S. Wand (Birmingham) declared that the medical profession was just as much responsible for armaments as the people in the factories, perhaps even more so. If it was the policy of the Government to limit the remuneration of the people in the factories, including the manufacturers themselves, without regard to the amount of work they put in or the work involved in the making of a particular article, then they would accept the position, but that was not the case at all. The Government was not taking that line, but quite the contrary, with manufacturers and employers of labour. He declared the amendment of West Suffolk to be defeatist. There was no more patriotic section of the community than the doctors, and they did not have to be told which was the right and proper time to apply for an increase in their remuneration.

Dr. P. V. Anderson (Durham) asked those representatives who had not increased their private fees to non-insured persons to put up their hands, and a number did so, but he declared it to be an obvious minority. It seemed clear to him that they should go forward in the endeavour to have their fees for National Health Insurance work increased.

No Breach of Faith

Dr. Gregg said that he had listened with interest to the case put by West Suffolk. It was suggested by the proposer that the Conference would be going back on some resolution previously adopted. That was not true. They did wring from the Minister an undertaking that at the end of the war the whole question of remuneration would be gone into from the foundation without any relation whatever to previous figures, and what was now being dealt with was not the basic remuneration. It was a short-sighted view that because the remuneration was basically inadequate there was no sufficient reason for claiming a wartime increase. On the question of doctors' incomes in general, the committee had had voluntary statements from all parts of the country regarding the decrease in income which doctors had sustained. It was true that there might be here and there isolated instances of people who were not suffering such decrease, just as there were isolated instances of people who were making money out of the war. But that was not true of the vast majority, and the information available showed that there had been a general reduction of the income of doctors by at least 33⅓%.

The West Suffolk amendment to postpone the renewal of the claim for a cost-of-living increase was lost. There appeared to be only about half a dozen hands raised in its favour. The motion of the Insurance Acts Committee expressing grave dissatisfaction with the Minister's rejection was carried by an overwhelming majority. A motion by Somerset was also carried urging the Insurance Acts Committee to press the matter to its utmost limits. Dr. C. R. F. Killick, the mover, said that the dissatisfaction over the question of the war bonus was increased by the fact that the basic payment was so inadequate. Practitioners were at call for 24 hours a day and seven days a week, and for their services to insured patients they received just over 2d. per capita per week. He did not suppose that this was realized by the general public.

Proposal to Ask for Arbitration

Having expressed its grave dissatisfaction, the Conference proceeded to the consideration of a number of motions and amendments—amounting to over 30—on the agenda proposing various courses of action. Dr. Gregg, on behalf of the Insurance Acts Committee, proposed that the committee be instructed to request the Minister to submit its claim for a wartime increase in the capitation fee to arbitration. He pointed out that various alternatives were mentioned in the resolutions. There was the alternative of resignation from the service—which he did not think many would contemplate—the alternative of a revision of the terms of service, and the alternative of the method of deferred payment. But it was felt by the majority of the committee that arbitration should be the next step, although the associated difficulties were fully recognized.

A very long debate then took place. An amendment by Lancashire instructing the committee to apply to the Minister for a wartime capitation fee of 14s. per head per annum, and, failing satisfaction, to call for the giving of the requisite notices of withdrawal from panel lists by all panel practitioners, was rejected by a very large majority. Eventually an amendment by Cumberland instructing the committee to press for reconsideration by the Minister, failing which the committee would reserve the right to take any action which it considered necessary, even to the extent of recommending practitioners to withdraw from the service, was carried by 85 votes against 67, and became the substantive motion. A large number of other amendments were then referred to the committee for consideration as possible methods of implementing the Cumberland motion.

A summary of these discussions will appear in a later issue.

THE B.M.A. AT WORK

MEDICAL ATTENDANCE ON SERVICE PERSONNEL

In view of the requests received by the B.M.A. from civilian practitioners for guidance on the regulations governing medical attendance on members of H.M. Forces who are taken ill when on leave, the following comprehensive memorandum has been obtained from the Service Departments.

1. *N.C.O.s, Men, and Women of the Army, Air Force, and Women's Auxiliary Services on Leave, Furlough, or Pass.*

(*a*) When N.C.O.s, men, and women auxiliaries proceed on pass they have instructions that should they require medical attention they should report, if practicable, to the nearest naval, military, or air force medical establishment. This instruction has been amplified to include civil hospitals under the Emergency Medical Service Schemes of England, Wales, Scotland, and Northern Ireland in the lists of medical establishments to which they should report.

(*b*) Personnel residing within 2 miles of a Service medical establishment and unable, owing to their condition, to report in person, are required to notify the Service medical establishment, which will be responsible for arranging medical attendance

(*c*) Service personnel residing more than 2 miles from a Service medical establishment may call in a civilian medical practitioner at the public expense if, because of their condition, they are unable to attend at any E.M.S. hospital which may be within the 2-mile radius.

(*d*) Having called in a civilian medical practitioner it is incumbent on them to notify their commanding officer at once, enclosing a medical certificate from the civilian medical practitioner. This certificate should state clearly whether or not the individual is fit to travel, as on the expiration of leave anyone fit to travel is required to return to his or her unit, where any further treatment can be arranged.

(*e*) If a civilian medical practitioner is called in when it is practicable for the individual to apply to the medical officer of a Service medical establishment or to attend at an E.M.S. civil hospital that individual may, after investigation by the appropriate Service authorities, be held liable for the expenses incurred. If the civilian medical practitioner is aware that although local Service facilities are available the man or woman has called him in, it will be in the best interests of all concerned if he communicates with the local Service medical establishment in order that any necessary medical attendance may be provided by that establishment.

(*f*) Claims for payment rendered by a civilian medical practitioner in respect of medical attendance or treatment afforded to personnel should be accepted as charges against public funds unless it has been established that the civilian medical practitioner was required to attend in contravention of the foregoing, when the individual concerned will be informed that payment is his or her liability.

(*g*) To obtain payment a civilian medical practitioner must procure and fill in Army Form O1667 (which is the same form as R.A.F. Form 1667). This form is obtainable from the officer commanding the patient's unit and from clerks to national health insurance committees. It sets out clearly the instructions for completing the form and the scale of charges allowed, and it should be completed according to the instructions and submitted immediately on conclusion of attendance to the officer commanding the patient's unit.

(*h*) In all cases the fees payable from public funds to civilian medical practitioners in respect of treatment cover any medicines required. The practitioner is therefore responsible for ensuring that the patient is supplied free of charge with such medicines as he or she may require.

2. *Royal Navy and W.R.N.S. Ratings and Royal Marine other Ranks on Leave*

(*a*) All personnel have instructions to apply for medical aid personally, if possible, to the nearest Service or civil hospital, or to a naval surgeon and agent. If, however, the case is extremely urgent and none of these facilities are readily available they should apply to the nearest medical practitioner.

(*b*) The "leave ticket" should be produced to the doctor, and for any services which are rendered the doctor will be paid in accordance with the scale shown in the claim form (Admiralty Form S.26). The scale fees include any necessary certificates and medicines. Payment in excess of the scale will be allowed at the discretion of the Admiralty if the case needs more than ordinary attention.

(*c*) (i) The claim form will be forwarded to the doctor by the patient's commanding officer on receipt from the patient of the first certificate, which should be forwarded immediately the person falls sick. (ii) Further certificates must be forwarded by the patient weekly so long as he or she remains sick on shore. (iii) A final certificate is to be taken by the patient to his commanding officer as soon as he or she is well enough to travel.

(*d*) It is essential that personnel should not remain sick at home longer than is absolutely necessary. Neither should the individual's residence be used as a sick quarters unless the patient is too ill to be moved or the distance to a Service, etc., hospital is too far.

(*e*) Personnel should be discharged to their units as soon as fit to travel; adequate facilities exist for further treatment on return, so they must not be kept under treatment on leave because they are unfit for duty.

(*f*) Payment for fees should be claimed on Admiralty Form S.26, which will be supplied to the doctor by the patient's commanding officer, as explained in para. 2 (*c*) above. Army and air force forms should not be used.

Other Circumstances in which a Civilian Medical Practitioner may be required to give Attendance to Troops

3. Men or women quartered in barracks or camps will normally have no occasion to apply to a civilian medical practitioner for treatment as there will be a Service medical officer in medical charge of the personnel there.

4. Men or women who, during training or attachment to a headquarters or formation in this country, are accommodated in billets or at their own homes should apply, if medical attendance is required, to the medical officer attached to their unit. (Cases under this heading, as well as those referred to at para. 3, should only require the services of a civilian medical practitioner in emergency when the Service medical officer is not available. Claims for fees in respect of such attendances should be submitted on Army Form O1667 (R.A.F. Form 1667), as described at para. 1 (*g*) above.

5. In certain instances a civilian medical practitioner may be asked to give regular attendance on a detached body of Service personnel for whom no Service medical officer is available. Such attendance will be arranged between the officer commanding the unit or detachment, the appropriate Service medical authority, and the civilian medical practitioner. Payment in such cases will not be on the basis of Army Form O1667 but at agreed rates, which are based on the number of personnel involved and the work to be done, and take into account distance to be travelled by the civilian medical practitioner and any other special circumstances involved.

PETROL FOR MEETINGS

As a result of further strong representations made by the B.M.A. to the Petroleum Department, it has been decided that, when other means of transport are not reasonably practicable, petrol granted to doctors for professional purposes may be used for journeys made to attend statutory committees (and subcommittees), such as panel and insurance committees and committees of local authorities; executive committees of public medical services; committees administering the Protection of Practices Scheme; and, subject to a limit of 20 miles, scientific meetings of medical societies on subjects directly related to wartime medical or surgical practice. As has previously been announced, journeys to meetings of Local Medical War Committees are permitted also. It is thought that doctors serving on medical committees or management committees of hospitals and other medical institutions will not normally need to make journeys for the sole purpose of attending such committees, but, should this need occur, the regional petroleum officers will consider applications on their merits, in consultation, if necessary, with the medical liaison officers. Finally, members of central committees of the B.M.A. who are resident in the Metropolitan Police area may attend meetings of these committees by car when other methods of travel are not reasonably practicable.

The London County Council has agreed that the surgeon engaged to carry out pre-frontal leucotomy at its hospitals and institutions shall be paid a fee of £6 6s. a session of approximately 2½ hours' duration. Hitherto the operative work in connexion with this new method of treatment has been performed by a whole-time E.M.S. surgeon, whose services have been lent to the Council free of charge. This surgeon is now engaged only for part-time in the E.M.S., and any services rendered by him to the Council in respect of pre-frontal leucotomy will be part of his private practice, for which he is entitled to receive fees. It is desired by the Council to retain his services. The number of sessions estimated to be required is not more than 20 a year at present.

Correspondence

National Eye Service

SIR,—I am sorry to disagree with Mr. Bishop Harman regarding some of the statements he has made in his letter (*Supplement*, Oct. 24, p. 54). The National Eye Service has not been working well. 10 years before the war. If it had been, the formation of the Association of British Ophthalmologists would not have been necessary. We are extremely anxious about the provision now and in the future of an efficient eye service for the nation—a truly national medical ophthalmic service.

The questionary will not bring us one whit nearer our goal. It is useless for us to debate the matter with the approved societies until we set our own house in order. The contributions made by the approved societies together with the payments made by their members are sufficient to meet the case if the remunerations for labour were justly allocated. The price of glasses to the insured patient should be the wholesale price plus the ophthalmic practitioner's fee plus the dispenser's fee plus the clerical fee minus the grant from the approved society. The relative value of the ophthalmologist's fee and the dispenser's fee should receive very careful attention.

When it comes to a consideration of insured patients whose earning power is above £250 per annum no doubt the approved societies will exercise the means test and the weekly contribution will be increased according to the worker's earning power. The ophthalmic medical practitioner's fee and the dispenser's fee should be augmented then in a similar fashion.—I am, etc.,

London. FRANCIS E. PRESTON.

N Browne, £3 3s (2nd donation): Dr. J A Ireland, £10 (2nd donation), Dr R C Neville, £3 3s (2nd donation); Dr T. R. Elliott, £3 3s. (2nd donation); Dr C. U Whitney, £5 5s. (2nd donation), Drs Legge and Legge, £4 4s (2nd donation); Dr G. Mackie, £5 5s. (2nd donation); Dr R. H S. Marshall, £10 (2nd donation); Mr. J. G. C Spencer, £5 (3rd donation). (Correction. The donation of £5 credited to Dr. E L. N Rhodes in the Thirty-sixth List under Shropshire and Mid-Wales should have been credited to Dr. A. J. Rhodes).

£5.—Doctors in the Isle of Man—per Dr D Pantin (amount already sent £130 16s.).

Local Medical and Panel Committees

£150.—Derbyshire (4th donation).

£52 10s.—Carmarthenshire.

£32 1s. 5d.—East Lothian (6th donation).

£5 5s.—County of Forfar (2nd donation).

Total—£47,442 1s. 3d, and £100 3½% *Conversion Stock* and £40 3% *Defence Bonds*

Cheques payable to the Medical War Relief Fund should be sent to Dr G C Anderson, Honorary Treasurer of the Fund, British Medical Association House, Tavistock Square, London, W.C.1

BRITISH MEDICAL ASSOCIATION

OPHTHALMIC GROUP COMMITTEE

The following have been elected members of the Ophthalmic Group Committee of the B.M.A. for the three years 1942-5:

REGION 1: Dr. H. R. Bickerton (Liverpool), Mr George W. Black, F.R.C.S. (Leeds), and Dr A B. Nutt (Sheffield).

REGION 2: Mr T. Harrison Butler, F.R.C.S (Birmingham), Dr. N P. R Galloway (Nottingham).

REGION 3: Dr. F. Heckford (Isle of Wight), Dr. D Wilson (Torquay).

REGION 4: Mr. N. Bishop Harman, F.R.C.S (London, W 1), Mr. O. G. Morgan, F.R.C.S (London, W.1), and Mr. Humphrey Neame, F.R.C.S (London, W 1).

REGION 5: Dr. F. Oliver Walker (Dartford)

REGION 6: Mr. C. R. Duncan Leeds, F.R.C.S (Edinburgh), Dr. John Marshall (Glasgow)

By ophthalmic medical practitioners (not eligible for membership of the Group) for the time being approved for examination of patients under the National Eye Service:

Dr. R. Gordon Simpson (Winchmore Hill, N 21)
Dr. C M. Stevenson (Cambridge).

The constitution of the committee provides for the appointment of one member by the Council and one member by the Insurance Acts Committee. These appointments have not yet been made.

Meetings of Branches and Divisions

NEW SOUTH WALES BRANCH

The annual report of the New South Wales Branch for the year to March, 1942, strikes some familiar notes. For example, the Branch Council appointed a committee to deal with the question of petrol supply for doctors; schemes for the protection of practices of doctors on active service were approved; and the shortage of doctors was the subject of a deputation to the Minister of Health. In spite of the fact that over a quarter of the members of the Branch (475 out of 1,894) were engaged in full-time military duties, 10 ordinary and 8 clinical meetings were held during the year, 7 of the former taking place in conjunction with specialty groups. The clinical meetings, which were held in different hospitals, included 21 papers and addresses, reports of cases, demonstrations, etc. Members of the legal profession and the police force attended an ordinary meeting on Oct. 30, 1941, at which the subject for discussion was "Driving under the Influence." On Dec. 11 Major-General Downes, Inspector-General of Medical Services, spoke to an ordinary meeting on "The A.A.M.C. in the Middle and Far East."

SOUTHERN BRANCH

At the 68th annual general meeting of the Southern Branch, held at Southsea, the following officers were elected: *President*, Dr. H. H. Warren. *President-Elect*, Dr. W. A. Clayton Cox. *Vice-Presidents*, Dr. T. Beaton and Mr. P. Maynard Heath. *Honorary Secretary and Treasurer*, Dr. John Clayre.

In his presidential address Dr. WARREN referred to the fact that the Southern Branch was the only United Kingdom branch which had suffered dismemberment by enemy action. He paid tribute to the outgoing president, Dr. R. Arderne Wilson of Guernsey, and expressed the sympathy of the Branch with its members in the Channel Islands. The president said that the drain on man-power had nowhere been heavier than on the medical services, and the stage had been reached when only by the general public exercising intelligent economy in their demands on doctors could an efficient service be maintained if the needs of the Forces were to be met. In adjusting his mind and attitude to the needs of the moment the doctor must remodel his consideration of personal comfort and the management of individual practice in his effort to hold the balance evenly between his duty to his patient and his duty to the State, maintaining that individuality of thought and practice which had always been the foundation of the medical profession in this country and the basis of the confidence of the general public in its integrity and skill.

UNITED PROVINCES BRANCH

At the annual general meeting of the United Provinces Branch, held at Lucknow on Jan. 30, with Dr. G. H. MARCHANT in the chair, the secretary's report for 1941 was read and adopted, and the following officers were elected for 1942: *President-Elect*, Rai Bahadur Capt. K. S. Nigam. *Vice-President*, Dr. E. A. Douglas. *Honorary Secretary and Treasurer*, Dr. V. S. Mangalik. *Auditor*, Dr. T. Prasad.

Later in the day the first clinical meeting of the year was held, and the following cases were demonstrated: by Dr. B. B. BHATIA, (1) congenital heart disease, probably either Eisenmenger's complex or patent foramen ovale, (2) intracranial tumour in the region of the midbrain in a boy of about 12, and (3) chronic abscess of the lung (right middle lobe); by Dr. B. N. SINHA, traumatic paraplegia of three years' duration and relieved considerably after laminectomy; by Dr. S. S. MISRA, "acute" pellagra in a man of 35.

At a clinical meeting of the United Provinces Branch, held on Feb. 27, with Dr. G. H. Marchant in the chair, Major MAN SINGH showed cases of amyotrophic lateral sclerosis, and mitral and aortic valvular disease of rheumatic origin. Dr. HAMID showed an interesting case of trigeminal neuralgia involving supra- and infra-orbital branches of the trigeminal nerve with flushing and lacrimation but without tic. In Dr. Bhatia's absence Dr. SHARMA demonstrated a case of subacute combined degeneration with macrocytic anaemia, without glossitis or enlargement of the spleen. Dr. H. SAHAI discussed the case and suggested the possibility of its being one of vitamin B deficiency.

H.M. Forces Appointments

ROYAL NAVY

Surg. Lieuts. C. J. Robarts, W J. Latham, and W. S. Parker to be Surg. Lieut-Cmdrs.

ROYAL NAVAL VOLUNTEER RESERVE

Prob Temp Surg. Lieuts. R. J. T. Woodland, G. C Milner, C J Laws and D. V. V. Bowen-Jones to be Temp. Surg Lieuts

ARMY

Major B. Johnson, D.S.O. (ret Col, late R.A.M.C.), is restored to the rank of Col. on ceasing to be employed.

ROYAL ARMY MEDICAL CORPS

Capts (War Subs Majors) R T. Shipman and C B. R. Pollock to be Majors.

TERRITORIAL ARMY, R.A.M.C

Capt. T. A S Kennerley has relinquished his commission on account of ill-health and is granted the rank of Major

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Capt I. B. Gartside has relinquished his commission on account of ill-health and is granted the rank of Capt

Lieut H Levin has relinquished his commission on appointment to a commission in the S.A.M.C

N L. Corkill, M.M., to be Lieut.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C

Barbara J Greenwood, M.O., has been granted a commission in the rank of Lieut

ROYAL AIR FORCE

Beryl Bolton to be M.O. (Emergency) with the relative rank of Fl. Lieut. for employment with the R.A.F.

ROYAL AIR FORCE VOLUNTEER RESERVE

Fl.-Lieut. E. S. Brawn has resigned his commission and retains his rank

To be Fl Lieuts. (Emergency): T. R. M Bristow and E. T Owen.

Flying Officers A. E. A. Cordin, L R. Holt, J McMillan, J. M Duncan, J. L. Coleman, G. W E Studley, W H. Barbour, J. G. Eadie, S. Haythornwaite, L. H Moss, J B Brownlie, J. A. Elliott H J. Fenn, J H. B Cantley, G H. Flack, I G Williams, R. W G Sutton, and T. S Wilson to be War Subs. Fl. Lieuts.

Flying Officer G. J C. Brittain has relinquished his commission on account of ill-health and retains his rank.

Flying Officer E. G. M. Palser has relinquished his commission on account of ill-health.

To be Flying Officers (Emergency): P. J. Brice-Curtis, C L Crawford, A. R Marsh, A. R. B Mills, M. P. Nelson, A. E Tinkler, E. F. Twiss D N. Walder, A. M Jorkes, and J. McM-Mennell.

INDIAN MEDICAL SERVICE

Lieut.-Cols. J. C. De, R. V Morrison, and B. F Eminson have retired.

Capts. C. H. Brink and P. M. McSwiney to be Majors

EMERGENCY COMMISSIONS

Lieuts (on probation) L. W. Ashton-Rose, F. B McCay, A M Kerr, G. A. Ransome, C. G. Muller M Seager, B J Niall, L. Rich, G L L. Reynolds B. Rowlatt, and J. L. Roberts to be Capts. on probation.

To be Lieuts (on probation): Myra K. Beattie Georgina E Brindley, E. R. James, E. G Michelson, Coralie L M. Drummond, and Lorna James.

POSTGRADUATE NEWS

The Fellowship of Medicine announces: M.R.C.P course in neurology Tues. and Fri, 2 30 p.m at West End Hospital for Nervous Diseases, Inpatient Department, Gloucester Gate, Regent's Park, N.W., from Dec. 1 to 18.

WEEKLY POSTGRADUATE DIARY

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W—*Brompton Hospital*: Tues. and Thurs, 4 30 p.m, M.R.C.P course in chest diseases *London Chest Hospital*: Mon., 10 a.m., and Fri., 2.30 p.m, M.R.C.P. course in chest diseases *National Hospital for Diseases of the Heart* Tues. and Wed, 10 a.m, Out-patient Clinics

DIARY OF SOCIETIES & LECTURES

ROYAL SOCIETY OF MEDICINE.—*Mon*, 4 30 p.m Section of Odontology. *Tues.*, 5 p.m. Section of Medicine. *Thurs.*, 4.30 p.m Joint meeting of Sections of Urology and of Neurology. *Fri.*, 2 30 p.m Section of Disease in Children; 2.30 p.m Section of Epidemiology and State Medicine

CHADWICK TRUST.—At Westminster Hospital Medical School, Horseferry Road, S.W, *Tues.*, 2 30 p.m Sir Arthur MacNalty: Prevention of Tuberculosis in Peace and War.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W—*Mon*, 4 p.m. Discussion. Surgery in the Middle East To be introduced by Lieut.-Cols E. G Muir and A E Porritt, R.A.M.C.

ROYAL NATIONAL THROAT, NOSE AND EAR HOSPITAL Gray's Inn Road, W.C.—*Fri.*, 4 p.m. Mr. W. G Scott-Brown: Wartime Injuries.

APPOINTMENTS

BECK, DIANA J. KINLOCH, F.R.C.S., Honorary Neurosurgeon, Royal Free Hospital, London

PENTREATH, E. U. H., M.B., B.S., D.P.M., Medical Superintendent, Mickleover County Hospital Derbyshire

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue

MARRIAGE

LAIRD—PATTISON.—On Oct 17, 1942, at All Saints Church, Ecclesall, Sheffield, Martin Laird, M.B., Ch.B., son of Mr. and Mrs. Laird, 4, Brentwood Road, Sheffield, to Joan Pattison M.B., Ch.B., daughter of Dr. and Mrs Creswell Lee Pattison, The Bungalow, King Edward VII Hospital, Rivelin Valley Road, Sheffield

DEATHS

RICE.—On Nov. 8, 1942, at 7, Castle Road, Bitterne Park, Southampton, Edward Rice, M.D., formerly of Coventry and Oxford, aged 84 years.

WALKER.—On Nov. 3, 1942, at Trenabie House, Westray, Orkney, Ernest Walker, M.B., Ch.B.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY NOVEMBER 28 1942

ANNUAL PANEL CONFERENCE

(continued)

CLAIM FOR WARTIME INCREASE IN REMUNERATION

The earlier proceedings of the Annual Panel Conference were reported in the last *Supplement*. Following upon a motion in the name of the Insurance Acts Committee that the committee be instructed to request the Minister of Health to submit to arbitration the claim for a wartime increase in the capitation fee a long discussion took place.

Dr. A. S. Winstanley (Lancashire) moved as an amendment to instruct the committee to apply for a wartime capitation fee of 14s., and, failing satisfaction, to call upon practitioners to give the requisite notices withdrawing from panel lists. This action did not imply a "strike," because the insured population would obtain their attendance in another way—namely, by the universal application of the "own arrangements" clause, drawing their medical benefit by a kind of grant in aid.

The amendment was opposed by Dr. C. M. Stevenson (Cambridgeshire), who said that it meant a strike even if it was not so called, and he did not believe that such action would enlist any adequate support; he disagreed with a statement that the profession had suffered a 33⅓% reduction in income. Dr. H. M. Golding (Bristol) held that resignations should be handed in only if arbitration failed. Dr. Fraser (Cumberland) said that while no one wanted to go the length of resigning in wartime that step might be necessary to convince the Minister that they did not intend to take his refusal as the last word. The Minister must be made to realize that they were not merely passing pious resolutions or practising bluff, and that "appeasement" was a thing of the past. His committee had little faith in arbitration.

The amendment was supported by two other Lancashire representatives. Dr. A. Campbell said that to go direct to arbitration was "sheer lunacy," and Dr. T. J. Costello said that the result of all approaches to the Ministry had been deplorable. The time had come either to withdraw from the fight or to take the gloves off and go into it properly.

Dr. A. Beauchamp (Birmingham) considered that arbitration should not be the first step. The Minister had said that there was no more money available. Practitioners therefore should ask for a new contract in which certain services now included, such as late and night visits, anaesthetics, and attendance at miscarriages, should no longer be obtainable as part of insurance benefit. Refusal of service did not mean withdrawal of clinical work, but only that certain services would be outside the contract. Dr. F. E. Gould (Birmingham) spoke to the same effect. In the Birmingham Public Medical Service a fee was charged for late calls. It did not disadvantage patients and by discouraging trivial calls it added a great deal to the doctor's convenience. Never were insured patients better able than now to pay a small sum for extra services.

The Lancashire amendment was rejected by a very large majority.

Dr. W. D. Steel (Worcester) moved to instruct the committee to formulate a scheme for presentation to the Ministry to provide a war subsidy for practitioners suffering serious hardship from war conditions. This was supported by Dr. F. Gray (London), who said that such action would not prevent other lines of procedure from being followed. Dr. C. M. Stevenson (Cambridgeshire), also in supporting, said that he had in mind East Coast practitioners who had been hard hit by the depopulation of their areas. A general war bonus would most advantage practitioners in reception and munitions areas who needed it less. Dr. J. Beck (Glasgow) opposed the motion on the ground that negotiations had always been on a national basis, and to substitute a sectional or areal one would damage the unity of the profession. The National Insurance Defence Fund might be used to help practitioners who were suffering in the way described.

The motion was lost.

Are Funds Available?

Dr. J. A. Brown (Birmingham) said that whatever was done about arbitration the Ministry might contend, as it had often done, that no money was available. The I.A.C. in the early days staked a claim for practitioners to a share in the funds accruing after all statutory benefits were met and adequate reserves built up. It would have saved a great deal of trouble if part of the surpluses credited to or in the hands of approved societies had been set aside as a contingency fund. The exhaustion of the medical pool would have been avoided. A laboratory service might in that event long ago have been provided. It was true, as the Ministry said, that there was not sufficient money in the medical benefit pool as fixed by statute, but there was a considerable amount in what should be a general pool, though the Minister would have to go to Parliament for legislation if the distribution of the total contributions was to be made more equitable. Money had been accumulated by the approved societies as surpluses, not entirely through the financial genius of those societies, but partly as a result of the work of the profession in reducing the incidence of sickness, and partly through the generosity of the Government actuary in calculating the amount required by the approved societies for their various activities. At every valuation there had been a substantial surplus, and the amount not disposed of had been carried forward to meet certain contingencies which had not in fact arisen. The last valuation showed a surplus of nearly £38 000 000 in the hands of approved societies and a disposable surplus of £20.000.000. That was a surplus which might be disbursed on additional benefits. The approved societies did not need to draw on surplus funds. They should have what was necessary as reserves, but the piling up of surpluses had gone on long enough. The medical benefit pool might be a first charge on the funds, but it had, so to speak, been arrived at backwards, or else on the assumption that it was a fixed sum about which there was no need to worry. If it was agreed to go to arbitration he suggested that these considerations might be urged upon the Minister as a means of finding the money for the increased remuneration.

Carte Blanche for the I.A.C.

The following amendment by Cumberland was next taken:

> That this Conference instructs the Insurance Acts Committee to press for reconsideration by the Minister, failing which the Insurance Acts Committee reserves the right to take any action which it considers necessary, even to the extent of recommending practitioners to withdraw from the National Health Insurance service.

Dr. S. Wand (Birmingham), after pointing out the importance of this amendment, suggested certain arguments which might be used if it was decided again to approach the Minister. It might be pointed out to him that production depended upon health, and that the health of the insured person depended upon the skill and zeal of the insurance doctor. The Government should think again and take heed before refusing to grant their very just demands, for never had those demands been more just. It should be pointed out to the Minister that by his refusal he was creating a serious situation for the health of the community. Tied up with this was a later amendment by Cheshire, which suggested an increase in the capitation fee payable by bonds, redeemable after the war. He asked the Conference to pass the Cumberland resolution and make a last appeal to the Minister.

Dr. F. Gray (London) hoped the Conference would not pass the Cumberland resolution. In effect it told the Minister that he had made a false statement, that the money was available, and that if practitioners were not given it they would strike. The strike question had been settled by the rejection of the Lancashire amendment, but to make threats would harm the position of practitioners both now and in the future. The Minister had said that it was not the policy of the Government to grant such increases. Why press him again? Why not take the alternative course suggested in an amendment next to be moved by Birmingham, for which there were sound arguments?

The Cumberland amendment was carried by 85 to 67.

Dr. Gregg, chairman of the committee, confessed that he found some difficulty in knowing where they stood. The committee had been criticized for its policy of appeasement and on other grounds, and now it was given *carte blanche* to take any action it liked.

Proposed Variations of Terms of Service

Dr. H. G. DAIN (Birmingham) moved to request the Minister to agree to a variation of the terms of service to provide that insured persons should pay for certificates, for late and night visits, for anaesthetics, and for attendance at miscarriages, or to agree to a wartime increase in remuneration in the form of a post-war credit. He suggested that these should be taken as first alternatives, and if refused the case should go to arbitration. One point to bear in mind was that greatly increased amounts of money were now coming into the insurance fund because the average number of weeks worked, taken by the actuary on a peacetime basis, was being considerably exceeded in the war effort, so that the number of stamps surrendered must be largely increased. Dr. Gray had said that it was not the policy of the Government to grant these increases. Whether policy or not, it was their practice. Certain types of people were receiving more money, via commercial undertakings, if not from a Government Department direct. As for arbitration, should that be the final course, there were two unanswerable arguments to lay before an arbitrator: the increased amount of work and the alteration in the character of insurance lists, whereby the healthy lives were removed and their places taken by the older and less fit, and also the abandonment of the known rule as to optimum hours of work in industry, so that many people were now working over-long hours, with a resulting higher incidence of minor ailments which had maintained their summer surgeries at winter levels.

The motion was opposed by Dr. H. S. HOWIE WOOD (Isle of Wight), who thought that despite its superficial attractions it would prejudice their case in the post-war inquiry; by Dr. J. N. HUDSON (Croydon), who said that this introduced a new and regrettable factor into insurance practice—the acceptance of money for service to insured patients; and by Dr. D. L. S. JOHNSTON (Halifax), who thought that the first part of the motion was likely to alienate the sympathy of their patients, and to throw patients into the arms of the public health services, against whose encroachments the profession had often protested. As for post-war credits, the money was wanted now, and this suggestion would provoke the reply that the money was required, not to meet a present need, but for investment.

Dr. A. T. ROGERS (Kent) suggested that the alternatives were put in the wrong order. If partial withdrawal of service were put first, and it failed, the case for arbitration might be weakened. Dr. F. GRAY (London) also opposed the first part of Birmingham's proposals. For years the profession had built up a good and complete service, and it was now proposed to cut down its content. What proportion of the capitation fee, after all, did these services represent? Threepence? He doubted it. It was all very well to say that insured persons were now able to pay. Would they be able to pay after the war? Dr. DAIN replied that there was no suggestion that this was anything more than a war measure. It put national health insurance patients in the same position as Public Medical Service patients. There would be no limitation of clinical services.

The Birmingham amendment was in two parts, one calling for a variation of terms of service and the other for an increase of remuneration by way of post-war credit. These were put separately to the Conference and both were negatived.

An amendment by Ayrshire proposing certain procedure as to arbitration was withdrawn after Dr. GREGG's request that this matter be left open. An amendment by the Isle of Wight to request the Minister to provide a wartime bonus by increasing the weekly contributions of employers and insured persons was lost. Dr. G. DE SWIET (London) moved to instruct the committee to pursue vigorously the claim for a wartime increase and to propagate it with all publicity in the Press and by approach to members of Parliament. He urged the method of paid advertisements, posters, and leaflets, as a means of informing the public.

The First Step

The bringing forward of these amendments was the subject of protest by some representatives, who pointed out that the Conference, by passing the Cumberland amendment earlier, had given the Insurance Acts Committee complete discretion to take any action which it considered necessary.

Dr. G. C. ANDERSON (Secretary) suggested that it would shorten the proceedings if, having passed the Cumberland amendment, the Conference signified whether in its opinion the first step should be arbitration. Then all the other resolutions on procedure could be referred to the committee.

The motion by the committee to request the Minister to submit the claim for a wartime increase to arbitration was put to the meeting and the show of hands was largely in its favour, but on the CHAIRMAN asking whether it was understood that they had decided that the first step should be arbitration there were cries of "No." Dr. GREGG pointed out that the Cumberland proposal, reserving the right to the I.A.C. to take any action it considered necessary, had been already carried as an amendment to his motion for arbitration, and should be regarded as the substantive motion before the Conference.

Dr. ANDERSON said that the Cumberland motion had been carried, and the Conference had now to consider in the light of that motion what first step it should recommend the committee to take. Should it be arbitration? Again there were cries of "No." The CHAIRMAN now ruled that the Cumberland motion, which had been carried as an amendment to the committee's motion for arbitration, was the substantive motion before the meeting.

Dr. A. BEAUCHAMP (Birmingham) then moved that a large number of amendments on the agenda proposing various courses of action in different circumstances, including matters such as post-war credits, reduction of required services, increased weekly contributions, and so forth, on which the Conference had already expressed a divided opinion, be referred *en bloc* to the Insurance Acts Committee for consideration as possible methods of implementing the Cumberland motion.

Dr. GREGG said that he hoped the Conference realized what it was doing. His own motion for arbitration had been met by an amendment by Cumberland in effect instructing the I.A.C. to do anything it liked (which would, of course, include arbitration among other alternatives) and this had been carried. Now it was proposed to refer a number of alternative and elaborating proposals which the Conference had not yet approved. His committee wanted only to make sense out of a very confused position.

Dr. N. B. S. STEWART (Edinburgh) said that his Panel Committee had met twice and on both occasions had opposed any reduction of services. Dr. D. L. S. JOHNSTON (Halifax) said that the Conference had got into a muddle through a confusion of ideas. The motion by Cumberland gave a free hand to the committee to pursue the matter as vigorously as it could, not excluding the possibility of arbitration. But his committee also was against any reduction of services. Dr. L. J. PICTON (Cheshire) said that he also was opposed to reduction of services, but he thought that the possibility of obtaining an increase in the capitation fee payable by bonds redeemable after the war should be in the forefront of the committee's consideration. It was true that this method would not ease the situation of very poor practitioners, whose case should receive special consideration. With regard to arbitration, if the arbitration decision were, in the Government's opinion, contrary to the public interest it could not be accepted. When the whole question was sifted from the bottom and the capitation fee basis considered, it would be a very different matter, but at the present juncture he thought it a doubtful expedient. Dr. F. GRAY said that whatever else the Conference was agreed on, it was agreed on this—that the I.A.C. was at liberty to take any means likely to effect its purpose. It seemed to him, therefore, that there was no need to go in for detailed discussion

The Cumberland amendment:

> That this Conference instructs the I.A.C. to press for reconsideration by the Minister, failing which the I.A.C. reserves the right to take any action which it considers necessary, even to the extent of recommending practitioners to withdraw from the National Health Insurance service—

which had been carried as an amendment by 85 to 67, was thus the decision of the Conference, and, the Birmingham rider having been carried, the other motions and amendments on this subject were referred to the committee in the light of this decision.

A motion by Southport that in view of the vital importance of united action by the profession at the present time the I.A.C. be instructed to endeavour to arrange a meeting with the committee of the Medical Practitioners Union in order to arrive at a joint plan of action was negatived. One other motion bearing on these negotiations was from Stoke-on-Trent, which asked that in future verbatim reports of all interviews with the Ministry on the matter of the capitation fee be made available for members of panel committees. Dr. GREGG said that he was sympathetic, but he felt that if this were done in all cases and at every stage of the negotiations it might hinder to some extent the freedom and frankness of discussion with Ministry officials. The motion was not pressed.

This concluded the work of the Conference on the capitation fee issue. The remaining business was largely concerned with the interim report of the Medical Planning Commission; there was also an important motion by Birmingham on the increase in minor illness. These will be summarized in the conclusion of the report of the Conference in a later issue.

THE LIBERAL PARTY'S HEALTH POLICY

Almost coincident with the publication of the draft interim report of the Medical Planning Commission, a subcommittee appointed by the Liberal Party has put forward proposals for "a positive and active health policy for the nation."[1] The chairman of the subcommittee was Sir John Stewart-Wallace, vice-president of Charing Cross Hospital, and one of the members was Lady Rhys Williams, whose name is associated with the organization of maternity services, but no member of the medical profession was on the subcommittee, though acknowledgment is made to Mr. Aleck Bourne for some assistance. The report proceeds very much on the lines of the draft interim report of the Commission, though it is stated that the proposals were formulated before that report was seen. One error into which the subcommittee falls—like other commentators on the interim report—is to assume that the report consists of definite proposals and recommendations rather than of questions the answers to which by the profession will guide the Commission in its further deliberations.

The Liberal Party, as was only to be expected, is opposed to a complete State Medical Service in which all doctors would be included on a salaried basis; but it is equally against the maintenance of an artificial independence of State control. Although it was the Liberal Party which brought in national health insurance 30 years ago, it is now opposed to the extension of it as the basis of an improved medical service. It suggests that even if the worker were willing to afford the increased deductions from his pay which would follow the bringing in of his dependants (who might include his great-aunts!), the employer might not be willing to make his increased contributions, and, if he were, there would still be discrimination against a man with a number of dependants when applying for employment. Insurance is a limitation of benefits to known premiums and known risks; an adequate medical service, on the other hand, means unlimited care of an incalculable number over incalculable periods. Therefore any scheme must depend upon direct State assistance through local authorities.

Traditionally Liberal Provisions

True to its traditions, the Liberal Party stresses the need for preserving individual liberty. The practitioner must have maximum freedom from lay control, the opportunity of private practice must not be withdrawn, free choice must be preserved, at least so far as it operates at present, and voluntary hospitals must remain independent and to some extent charitably financed. The party sees no dissonance between the maintenance of free choice and the widespread establishment of health centres, provided, equipped, and staffed by the local authority, and offering a service for all without any means test. Indeed, it makes much of the health centre as a place where consultants will also attend, and from which ophthalmic and dental services, maternity services, health visiting, and district nursing will operate. As for general administration, the Minister of Health, to whom the medical functions of the Board of Education and the Ministry of Labour would be transferred, would be advised by a statutory medical advisory committee of five members, all with medical qualifications, three appointed by the Minister, and the other two nominated by the Royal Colleges and the British Medical Association respectively. Statutory medical advisory committees would also be appointed in all autonomous areas to advise the local authority; half the membership would consist of doctors elected by their colleagues, the other half of councillors or persons appointed by councils.

Liberal Finance

The financing of the scheme would be by funds provided by Parliament on the request of the Minister. In addition to the amount allocated for medical, hospital, and auxiliary services, adequate sums would be voted for medical research and for the support of teaching hospitals, and a proportion of grant would be retained by the Minister for distribution at his discretion. The remuneration of practitioners would be partly by salary and partly by a capitation fee, and the same arrangement is proposed for consultants, who, in addition to an honorarium for attendance at the health centres, would receive a capitation fee for persons referred to them. Although it is assumed that only one million of the population will elect to remain on a fee-paying basis, private practice is to be permitted to both general practitioners and consultants, and the policy also includes provision for payment of pensions to practitioners on retirement at 65.

The cost of the service, in addition to existing public health expenditure, but allowing for a saving of £9,000,000 on the present National Health Insurance grant, would be £57,000,000 a year. This includes £22,500,000 for medical capitation fees at 10s. a head (merely a token figure, for it is admitted by the subcommittee that it has not enough evidence to suggest a satisfactory remuneration for doctors) for a population of 45,000,000. A further £11,000,000 is allocated to dental capitation fees at 5s. (again it is not clear on what basis dental service is ranked at half the cost of medical); medicines and appliances are supposed to cost £15,000,000; administration and pensions, £5,000,000; and £12,000,000 is allocated as maintenance grants to voluntary hospitals on the supposition that one-quarter of voluntary-hospital expenditure will still be met by charitable subscriptions.

The Liberal Party proposals are an interesting and challenging contribution to the discussion. It is to be hoped that their underlying assumption has some warrant—namely, a Government generous in its payment of the piper and modest in not calling for all the tunes.

In spite of prevailing conditions the year 1941-2 was one of the most successful the Gibraltar Branch of the B.M.A. has had. There was a considerable increase in membership due to the arrival of Service personnel, mostly attached to the R.A.M.C. Nine meetings were held, a record for the Branch: the annual general meeting, five clinical demonstrations, and three medico-political discussions, the Medical Planning Commission's report being one of the subjects debated.

"ANTI-FREEZE" FOR DOCTORS' CARS

Doctors are reminded that, as was announced in the *Supplement* last year, application for permission to acquire supplies of "anti-freeze" must be made to the Regional Transport Commissioners. Supplies are available only to persons engaged in essential work who, because of the nature of their work, cannot adopt alternative methods of protecting their cars against frost. The following are the addresses of the Regional Transport Commissioners:

Northern: 41-45, Gray Street, Newcastle-upon-Tyne, 1.
North-Eastern: 44, The Headrow, Leeds, 1
North Midland: Grosvenor House, Friar Lane, Nottingham.
Eastern: Sussex House, Robson Street, Cambridge
Metropolitan. Romney House, Tufton Street, London, S.W.1.
Southern: Chiltern Court, St. Peter's Avenue, Caversham, Reading.
South-Western: Beacon House, Queen's Road, Bristol, 8.
Wales: Graham Buildings, Newport Road, Cardiff
North Wales: "Holmleigh," St David's Road, Caernarvon.
Midland: York House, Gt Charles Street, Birmingham.
North-Western: Arkwright House, Parsonage Green, Manchester, 3.
Scotland 44-46, Palmerston Place, Edinburgh, 12.
Eastern Scotland: 14, Crown Terrace, Aberdeen
South-Eastern: Mount Ephraim House, Mount Ephraim, Tunbridge Wells.

DISCUSSIONS ON MEDICAL PLANNING BY THE FORCES

The B.M.A. has requested the Admiralty, War Office, and Air Ministry to allow free discussions among Service medical officers of the Medical Planning Commission's draft interim report, in view of the fact that the medical men and women temporarily in the Forces are the practitioners who will be most affected by plans now being made for the future of medical practice. The respective Service departments have now stated that there is no objection to medical officers attending meetings for discussions on medical planning and expressing their opinions thereon, provided their Service duties are not thereby affected, and that no contravention of King's Regulations or departmental instructions is involved.

The Medical Planning Commission accordingly hopes that as many medical officers as possible will take part in discussions on the draft interim report, which was published in the *Journal* of June 20 last, and that they will submit their criticisms and observations to the Secretary at B.M.A. House. The opinions they express will receive full consideration by the Commission.

B1 HOSPITAL APPOINTMENTS

The restrictions placed on the transfer to another hospital of holders of B1 appointments (*Supplement*, Aug. 20, p. 20) are to continue until the end of January, 1943. The Ministry of Health states (Circular 2730) that the question of reverting to the normal procedure under which class B2 and A officers are available respectively for filling B1 and B2 posts is under consideration, and pending a decision there is no alternative but to continue the restrictions on the holders of B1 posts. In any event, when the supply of class A and class B2 officers for the higher posts is resumed it will take a little time for the change to have full effect. It is hoped that it will be possible to issue a further circular on this subject before the end of January next.

SURGICAL CORSETS

Because of the limited quantity of rubber and steel available and the depletion of labour in the corset industry, it is necessary both to restrict the amount of rubber and metal permitted in ordinary corsets and to keep down the number of specially made surgical corsets. The quality of ordinary corsets is not good when compared with pre-war standards, but it is the best that is possible in present circumstances, and no woman ought to be able to get a surgical corset if she could wear an ordinary utility corset, with some discomfort perhaps but no harm to her health. It is hoped to provide for a small quantity of made-to-measure corsets for women of difficult figures. Certain firms are well known to have abused the concessions originally given for surgical belts ordered on a medical prescription. The Board of Trade is concerned to see that this shall not happen again, and that the manufacture of surgical corsets shall not increase at the expense of ordinary utility corsets. New regulations came into force on Nov. 9, in which a surgical corset is defined as " one cut and made specially for the person to whom it is supplied in accordance with a prescription in writing given by a registered medical practitioner, to which prescription is appended a statement that the practitioner has examined that person and that the corset is necessary for that person by reason of a disability, deformity, or disease specified in the prescription, being a corset in relation to which the practitioner has given a certificate in writing stating that he has examined that person while wearing it and that it is satisfactory for the condition from which the person is suffering." In short, a doctor in future must furnish two certificates for any patient requiring a surgical corset: one after examination of the patient, stating that the corset is necessary because of a specified condition, and a second after a further examination of the patient wearing the corset, stating that it is satisfactory for the condition in question.

Correspondence

Medical Organization

SIR,—Recent letters in the *Journal* from Dr. G. G. Airey (Nov. 7) and Mr. H. J. McCurrich (Oct. 24) show that at last it is being realized that one of the primary preconsiderations of any medical planning is to take into account the political aspect. The Lincoln Division considers that no organization working centrally as does the B.M.A. will ever have any chance of tackling the political side involved in this planning, nor ever be able to make its opinion carry the weight that its membership entitles it to throughout the country.

This Division's Planning Committee concluded that there should be regional secretaries for the B.M.A., each region corresponding to those proposed under the Nuffield hospital scheme, with each secretary drawn exclusively from G.P.s of at least 15 years' experience of practice, and not over 50 years of age on appointment. By adopting such a scheme the whole of the country would be well covered and members well represented. The B.M.A. is often wrongly called a trade union, but at least there might be some imitation of trade union organization, as there is great doubt that the trade union movement would have gained so much political strength had its organization remained entirely in the hands of the shop stewards, corresponding to our divisional hon. secretaries, with a central headquarters only. The unions opened branch offices all over the country, and the B.M.A. should do likewise to a limited extent.

It is realized that something on these lines was started just before the war, but there seemed small promise of this being extended to the extent here visualized. It is also realized that there is not the man-power to do it now, but the planning of the organization could be put in hand now, ready to start as soon as possible. Cost is also admittedly a difficulty perhaps, but it must be remembered that with regional offices a great deal of central expense could be eliminated, and it is reasonable to expect that with more intimate contact more members might be obtained.—I am, etc.,

Lincoln S. WRAY.

GENERAL MEDICAL COUNCIL

WINTER SESSION

The 156th session of the General Medical Council opened on November 24. The President, Mr. H. L. Eason, who was in the chair, spoke first of all in his address of the deep regret with which the Council had learned of the death of its late President, Sir Norman Walker. After referring to the many committees on which Sir Norman had served during his 34 years' membership of the Council, Mr. Eason said that his knowledge of the history of the Council and of its minutes was unique. There was no problem that came before it which he could not simplify by his familiarity with precedent and tradition, and with all this long service and vast experience he used his wisdom and judgment unceasingly for the benefit and the assistance of the Council. Mr. Eason referred to the deaths of Prof. David Waterston, Prof. Edward Fawcett (a member of the Council from 1925-35), and Dr. Leonard Kidd, " Father of the Council." Since the Council last met Mr. Harold Collinson, representative of the University of Leeds, had retired, but the Council had secured his services as inspector of qualifying examinations in surgery. In Mr. Collinson's place on the Council they welcomed Prof. Matthew Stewart, Dean of the Medical Faculty, University of Leeds. Dr. T. S. Hele had also retired from representation of Cambridge University, his place being taken by Prof. H. R. Dean of that university. Prof. Frank Kane of University College, Cork, replaced Dr. Leonard Kidd. Mr. Eason said the Council would have before it reports from the Education and Examination Committees on memoranda of evidence to be presented to the Committee on Curriculum and Examinations in Schools and the Interdepartmental Committee on Medical Schools. The profession was warned against accepting the unverified statements of other persons that they were qualified or registered. Recently an alien by false pretences obtained a recommendation and testimonials from doctors for professional purposes. Aliens who were on the *Medical Register* possessed not only a certificate of registration issued by the Council but a police registration certificate stating the conditions under which they are entitled to take up professional work. The President could not give any indication of how long the session would last; the penal business before the Council was likely to be difficult and possibly protracted.

H.M. Forces Appointments

ROYAL NAVY

Surg. Lieut. W. V. Owen has been transferred to the Emergency List. (Substituted for the notification in the *London Gazette* dated July 7, 1942.)

ROYAL NAVAL VOLUNTEER RESERVE

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue

DEATHS

DAGGETT.—On Nov. 7, after a short illness, at the Red House, Kirby Hill, Boroughbridge, Yorks, Henry Ingledew Daggett, M.A., M B., B.Ch Camb, M R.C.S., L.R.C P.Lond. (Camb. and St Mary's), aged 78.

MCKENDRICK.—On Nov. 2, 1942 (suddenly), William McKendrick, M B., Ch.B., aged 46 years, beloved husband of Dorothy, and father of William, Ian, and David, the Laurels, Blackwood, Mon.

WORTHINGTON.—On Nov. 14, at Lancaster Nursing Home, 1[illegible], Lancaster Drive, N.W.3, Helen Worthington, L R C P, L.R C S Ed., L.R F.P &S.Glas., physiotherapist, 121, Harley Street, W.1, aged 65.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY DECEMBER 5 1942

ANNUAL PANEL CONFERENCE

(*Concluded*)

National Insurance Defence Trust

The earlier proceedings of the Panel Conference, held on November 12, were reported in the last two issues of the *Supplement*. This concluding instalment covers the business remaining after the decisions on a wartime increase in the capitation fee had been taken.

Dr. J. W. BONE, treasurer of the National Insurance Defence Trust, reported that the securities valued at purchase price stood at £248,000, but at current price levels they were worth some £40.000 more than that.

Dr. R. C. M. COLVIN-SMITH (Norfolk) moved for immediate steps to be taken to increase the fund to £1,000,000. Dr. J. C. PEARCE (Norfolk) supported the proposal, saying that it was necessary to have a fund which would be really, in the eyes of the Ministry, formidable. Dr. E. A. GREGG, as chairman of the Insurance Acts Committee, gave his support to the resolution, which was carried unanimously. Dr. Gregg also accepted a motion from Glasgow calling for a more rigid definition of the conditions under which grants are made from the fund to ease the retirement from the service of aged or infirm doctors of straitened means against whom, as a result of such age or infirmity, a complaint has arisen or is likely to arise.

Increased Incidence of Minor Illness

Dr. J. A. BROWN (Birmingham) moved:

> That this Conference views with grave concern the great increase in the amount of minor illness among the insured population, and urges the Minister of Health to undertake an immediate investigation into the causes of the increase, with special reference to conditions, hours of work, overtime, and night work.

He said that surgeries had become increasingly crowded, and more and more of the time of practitioners was occupied with minor illness. Yet food was adequate, and bombing, with its attendant anxieties and depressions, was less severe. The obvious cause was industrial fatigue due to excessive working hours. Reports in the last war showed conclusively that there was a working period beyond which it was not safe to go if output and the health of the worker were to be maintained. Production was dependent upon health, of which practitioners were the guardians. He drew attention to what he described as a most extraordinary passage in the report of the Chief Inspector of Factories:

> "In some cases long hours are worked against the employer's better judgment; he knows that they may be expected to prove unremunerative in the long run and to be associated with a good deal of enforced absence from work; but the fact that such long hours are ostensibly worked is in the nature of a concession to a section of outside opinion which is prone to associate reasonable hours with personal slackness or with alleged waste of man-power and to the importunities of givers of contracts."

The last eight words seemed to the speaker very significant. Doctors nowadays were fewer, and their work was immeasurably greater. It was time for the Minister of Health to make his voice heard by his colleagues in other Government Departments. The resolution was carried.

Group Organization

Dr. GREGG moved a resolution urging Group Committees so to organize their areas as to ensure that views can be conveyed to and obtained from every insurance practitioner in the group in the shortest possible time. He said that the question of publicity was specially difficult at the moment, with shortage of paper and of labour, but one excellent way of achieving it would be by personal contacts at the periphery. Dr. A. T. ROGERS, chairman of the Organization Subcommittee, said that it was hoped to report very soon. The methods recommended for securing the most effective organization of insurance practitioners would vary with different parts of the country. A method suitable for London, which had one Panel Committee, would not be suitable for Group L, which stretched from Somerset to the Scilly Isles, or for Group K, where one member represented 13 different committees straddled across East Anglia.

The resolution was carried, together with a further motion urging the Group Committees to bring into consultation not only their directly elected representatives on the Insurance Acts Committee but other members of the committee resident within the group who are not directly elected—that is to say, the six members elected by the Conference and the six by the Annual Representative Meeting.

Dr. A. M. McMASTER (Rochdale) called for the creation of a special National Health Insurance section of the central secretariat and staff at B.M.A. headquarters. He paid a tribute to the present secretariat, but said that they were overworked, having to look after many competing interests, and unable to give the requisite time to protecting the interests of insurance practitioners. Dr. GREGG said that this important matter was now under consideration by the subcommittee. Dr. J. HALLAM (Stoke-on-Trent) said that he had been one of the critics of the I.A.C. though he was a member of it, but no one must suppose that the faults were all on one side. There were great faults at the periphery, as instanced by the relatively small proportion of replies received to the questions in the interim report of the Medical Planning Commission.

The Rochdale proposal was referred to the committee.

Planning Commission Report

The remainder of the Conference was devoted to motions and amendments arising out of the interim report of the Medical Planning Commission. Dr. T. H. DARLOW (Boston) moved that until the Beveridge report is available it would be inopportune to express an opinion on the Commission's report. He said that this was not put forward obstructively. The Minister on the occasion of the recent deputation had himself suggested that he could not do anything until the Beveridge report had appeared. The Chief Medical Officer of the Ministry, in his recent Harveian Oration, had said (*Journal*, Oct. 31): "Surely we are entitled to read into this [interim] report a realization on the part of the medical profession that their continued existence as a series of isolated units is in the interests neither of themselves nor of the public they serve." That was not a statement they had agreed to. Both reports opened up so large a subject that the end of a conference which had been occupied with a more immediate matter did not seem a fitting occasion to embark upon it. Dr. J. A. MOODY (Essex) suggested that a special conference should be called following the publication of the Beveridge report.

Dr. F. GRAY (London) said that they had been accused many times of being too late. Now they had a chance of putting their views forward in time. He hoped the Conference would agree that the work done on the Commission should not be put on one side until some other body came along and took the wind out of their sails.

The motion not to proceed with the consideration of this subject was lost.

Objects of Medical Service

Dr. GREGG moved acceptance of the broad definition of the objects of medical service:

> "(*a*) To provide a system of medical service directed towards the achievement of positive health, the prevention of disease, and the relief of sickness; and (*b*) to render available to every individual all necessary medical services, both general and specialist, and both domiciliary and institutional."

Dr. D. L. S. JOHNSTON (Halifax) desired to insert the words "by the method of private practice and by an insurance scheme for a limited section of the community." He recalled that the proposal to extend the provision for the whole community was carried by only two votes at the Annual Representative Meeting, and he thought that the present Conference might usefully clarify the position. His amendment to this effect, however, was lost.

Dr. A. SMITH POOL (Glasgow) moved to amend the motion in the sense that the State should make the provision. Many of them now believed, he said, that it was one of the duties of the State to provide a system of medical service, and that that service should be available to the individual as a right. Dr. GREGG said that this amendment had a political implication, and the Conference, if it passed it, should at least realize what it might mean, not to those present, but to the outside public. For his own part he was opposed completely to the State taking possession of the medical profession. (Applause.) He realized, of course, that many people were poor and many others were thriftless, and means must be found whereby such people could be assured of necessary medical services, but that was altogether different from handing over the profession, lock, stock, and barrel, to the State.

An amendment in the sense of the Glasgow representative's speech was lost by a very large majority.

Dr. GORDON WARD (Kent) moved to amend the definition of objects so that it would read: "To provide an organization directed towards the preservation of health, the prevention of disease, and the relief of sickness, and to render available to every individual all necessary medical services." The definition of objects of medical service or of health policy was a confession of their faith. Dr. GREGG said that what Dr. Ward wanted was the provision of an organization, which implied central direction. The system of medical services at present existing could hardly be called an organization in that sense. He saw no particular value in this variation of wording.

Only one or two hands were held up in favour of the Kent amendment, and the original motion of the I.A.C. was adopted.

Free Choice: Group Practice

Dr. GREGG next moved: "That free choice of doctor and patient should be an essential feature of any future service." He said that if, when a practice was transferred, no considerable body of the insured persons exercised their right of fresh choice but remained on the list of the practice, it was no valid argument that the principle of free choice was not appreciated. Many instances could be mentioned of insured persons who, having given the newcomer to the practice a chance, later transferred themselves to another doctor. He hoped that the principle of free choice to the largest possible extent would be maintained in any kind of service which was set up.

An amendment by Carmarthenshire to insert the words "as far as practicable" and to delete the word "essential" was lost, and the principal motion was carried without dissent.

Dr. GREGG further moved: "That group practice in some form is deserving of favourable consideration." This was a matter of difficulty, he said, because many people did not like certain forms of group practice and therefore opposed it altogether. The I.A.C. felt that the principle of group practice should be encouraged. Dr. JOHNSTON (Halifax) desired group practice to be on a voluntary basis. If it was compulsory the next step would be compulsory health centres provided by the Government. At the Annual Representative Meeting there was an overwhelming vote against a State Medical Service and a vote in favour of group practice and of health centres. It did not seem to be realized that if the latter were provided by the Government the payer of the piper would call the tune. Dr. C. F. T. SCOTT (Willesden) spoke also in favour of a voluntary basis for group practice.

The amendment to insert the word "voluntary" before "group practice" was carried.

Inclusion of Dependants and Others

Dr. GREGG moved: "That provision should be made by the Government only for persons compulsorily insured under the N.H.I. Acts, the dependants of such persons, and others of like economic status," whereupon came an amendment from West Suffolk to delete the word "only" and to add to the motion "and for the remainder of the population on a voluntary basis." The mover, Dr. N. STEVENS, said it was difficult to see how a policy of positive health could be carried out unless the whole community was included.

The West Suffolk amendment was lost, but another was moved by Halifax which had the effect of limiting the provision to persons with a gross income of £250 or under. Dr. JOHNSTON said that by some astute engineering the Ministry had managed to raise the income level to £420, and Halifax felt that after the war, with a slump in wages, very few people might be above that range. Dr. GREGG said that they were all in sympathy with the idea behind the amendment, but it was extremely difficult to get a practical application of it. They had to accept the position as it stood.

The Halifax amendment was lost, and an amendment by Derbyshire introducing the date Jan. 1, 1942, in order to define more clearly the status of insured persons included, was lost also, Dr. GREGG explaining that it was entirely a question of what was practicable. The motion that provision should be made for the compulsorily insured, their dependants, and others of like status was carried.

Health Centres

Dr. GREGG moved approval of the general principle of health centres. He said that this was a debatable subject, and there were many forms of health centre they would probably object to, but to the principle they ought not to be opposed. Dr. R. W. MCCONNEL (Bucks) moved an amendment to the effect that the establishment of health centres should not be by the Government, and that the Commission should be asked to explore the possibility of such centres being established by practitioners themselves. Dr. S. WAND supported the amendment. Future action of the Government, he said, might depend to a certain extent upon the ownership of the centres.

The amendment was carried. Dr. JOHNSTON (Halifax) moved: "That the compulsory establishment of health centres is undesirable as it tends to the establishment of a whole-time salaried Government medical service." Dr. J. HALLAM (Stoke-on-Trent) felt that health centres were being pushed upon an unwilling profession by a small section of the Commission. There should be no compulsion about the setting up of such centres, though no one could object to those who wanted to do so co-operating in their establishment at their own expense.

The Halifax amendment also was carried.

The Conference also agreed to the principle that all practitioners should have the right to take part in the service, that not enough information was available to enable an opinion to be expressed on the method of remunerating general practitioners under the Commission's plan, and that the goodwill of practices was a proper commodity for purchase and sale. A further amendment by Leicestershire was carried, calling for adequate compensation to existing practitioners if a sale of practice was not deemed advisable or if any service adopted precluded the possibility of such sale. Dr. A. HAMILTON, the mover, thought that the Commission should be asked to consider the financial fate of practices should a State Medical Service come into operation. He did not know on what ground many doctors based a feeling of optimism with regard to their practices in that event. A young man who had borrowed money to buy a practice which was confiscated might, if uncompensated, be left with a load of debt for the rest of his life.

This amendment also was carried.

Among other motions adopted was one in favour of the co-ordination and integration of health services on the basis of the plan broadly outlined in the interim report, and another in favour of the immediate post-war application of (1) the "two-way" extension of insurance to include dependants and others of like economic status, and to provide consultant and specialist services, (2) the establishment of experimental co-operative practice in some areas, and (3) the creation of regional hospitals councils with executive or advisory functions. Motions by Leeds and Buckinghamshire were also carried, the one urging the necessity for the removal of the control of sickness and additional benefits from approved societies should insurance be extended to dependants, and the other expressing the view that the administration of national health benefits by approved societies should be abolished in favour of some central body to ensure that the benefits were uniform. It was, further, the view of the Conference that if the scheme was extended to dependants, there should be adequate safeguards to prevent deterioration of the economic status of practitioners by an attempt to curtail the maximum numbers on lists or the capitation fee.

A motion on which the voting was somewhat dubious, but which was said to be carried, declared that no major change involving the addition of a group of new entrants should be introduced into the National Health Insurance service until after the present emergency. The final motion was by Newcastle-upon-Tyne, which urged a plebiscite of the medical profession on the form of service desired in the post-war development. Dr. G. C. ANDERSON (Secretary) pointed out that to be of any service the plebiscite should include all doctors in the Forces, very many of whom would be difficult to reach. Moreover, there was the paper shortage to consider. He hoped that this motion would not be pressed.

The motion was withdrawn on the understanding that the committee would take any step in this direction which appeared feasible.

Certain other motions remained on the agenda, but in view of the hour and the impending black-out the Conference agreed to the reference of all these to the I.A.C. for consideration and report.

The Ministry of Labour and National Service has recently given a decision on the position of part-time women doctors who are called for interview under the Registration for Employment Order. It has now been decided that when the local officers of the Ministry ascertain that a woman practitioner is following her occupation part-time only, her case shall be referred to the appropriate Local Medical War Committee. The Local Medical War Committee will then have an opportunity to explore the possibility of allocating further work to the practitioner concerned.

GENERAL MEDICAL COUNCIL

(*Continued*)

On the opening day of the winter session, briefly reported in these columns last week (Nov. 28, p. 68), the Council proceeded, under the Temporary Provisions Order by which no election of direct representatives shall be held before December 31, 1943, to fill the vacancy among the direct representatives for England caused by the death of Sir Henry Brackenbury. On the proposal of Dr. H. G. Dain, seconded by Col. H. L. Tidy, Dr. E. A. Gregg, chairman of the London Panel Committee and of the Insurance Acts Committee of the B.M.A., was appointed.

On the motion of the President, Prof. J. A. Nixon, Mr. Harold Collinson, and Sir William Fletcher Shaw were appointed, respectively, inspectors of qualifying examinations in medicine, surgery, and midwifery, under the Medical Act, 1886.

After deliberation *in camera* the Council restored the following names to the *Medical Register*: George Holman, Joseph Stenson Hooker, Andrew Thornton, John Mackay Young, and Benjamin David Ling.

DISCIPLINARY INQUIRIES

The Council then began upon an unusually large programme of disciplinary inquiries. Twenty-one practitioners were summoned to appear before the Council to answer certain charges, 7 of them on charges relating to certificates alleged to have been improperly given for the purpose of enabling certain persons to evade military or other war service.

A number of cases in which convictions of drunkenness or of being in charge of a car while under the influence of drink or of similar misdemeanours had been proved at a previous session, but in which judgment had been postponed, were first considered. In all these cases the assurances and testimonials of the respondent practitioners were accepted and the Council did not see fit to instruct the Registrar to erase the name. The cases were those of Reuben Denny, registered as care of an address in Jermyn Street, London, Hugh Boyd Gillespie, registered as of Langside, Glasgow, Joseph Owen Kelly, registered as of Strathview, Lanark, Jerome Thaddeus O'Leary, registered as of Tottenham, Daniel Joseph Purcell, registered as of Naas, Co. Kildare, and Arthur Mervyn Rhydderch, registered as of Llandudno.

Charges of False Certification

On Nov. 25 and 26 the Council considered the case of Dr. Louis Aimée Newton, registered as of Stanley Road, Teddington, against whom it was alleged that he had issued false or misleading certificates in three cases, stating that he had attended the men respectively for six months, for some months, and for seven years, and that two of them were subject to epileptiform attacks, while the third, he believed, had commencing disseminated sclerosis; whereas in fact he had not attended these persons for the period stated or for the condition mentioned.

The complainants were the Ministry of Labour and National Service, represented by Mr. Gerald Howard. The respondent was defended by Mr. G. D. Roberts, K.C., and Mr. T. K. Eadie. The names of the persons to whom the certificates were given and all of whom appeared as witnesses were not divulged.

Mr. Roberts put in a preliminary plea on behalf of Dr. Newton, that the allegations against the doctor involved a serious offence against the criminal law. There were many cases of "infamous conduct," he said, of which the courts could not take cognizance, but in the present instance the charges were such that one would imagine that, if the authorities felt that sufficient evidence was available, they would have instituted criminal proceedings, in which they would have power to subpoena witnesses, which the Council did not possess. In four out of the five cases which appeared in the charge it was alleged that Dr. Newton had "aided, abetted, counselled, or procured the said . . . to produce in himself an apparent disability." He thought it was a fair inference, therefore, that the material available was considered insufficient to justify the launching of criminal proceedings.

The President pointed out that the Director of Public Prosecutions had a discretion to act or not to act on many other grounds. The case then proceeded.

In one of the cases, the witness, who was described as "I. J.," said that he was 27 years of age, the son of a butcher of whom Dr. Newton was a customer. He had been attended by Dr. Newton for minor complaints, but had never suffered from epilepsy or fainting attacks. In 1940, when his registration was imminent, he came into touch with a Miss Bentley—though he was not sure that that was her real name—who coached him in the simulation of epileptiform convulsions, and took him to three doctors, whose names were mentioned. On one occasion while in his butcher's shop he "shammed a fit" in Dr. Newton's presence, for which he was treated. In the interviews with the doctors "Miss Bentley," to whom he paid £200, did most of the talking; he himself, under instruction, appeared to be as drowsy and stupid as possible. Dr. Newton gave him a certificate in which he stated that he had known him for the past seven years, "during which time he has suffered from epileptiform attacks. He momentarily loses consciousness and falls down. . . ."

In cross-examination a certificate by another doctor was put to him, stating that the man had been treated by him for epilepsy of idiopathic origin, and he believed him to have come of an epileptic family. This doctor had not actually seen him in a fit. But a third doctor, to whom he was taken by Miss Bentley, saw him in feigned unconsciousness. This doctor wrote that he was told that the man had been unconscious for some ten minutes before his arrival. He found that he had bitten his tongue, his pupils were fixed, and he showed other familiar signs. The witness agreed in further cross-examination that Dr. Newton, who had known him for several years as his medical attendant as well as his customer, had had no reason to suspect that there was anything "fishy" about him. He began to pretend to Dr. Newton that he was epileptic about three or four months before he was called before the medical board.

A witness from the Ministry of Labour and National Service stated that on his first medical board, on the strength of the certificates produced, this man was put in Grade IV. Afterwards, as a result of police inquiries, he was reboarded four months later and placed in Grade II. The witness, I. J., recalled, stated that on the occasion of his first medical board he never got out of the car which took him to the place of examination, but that the five doctors went into the car one by one and examined him there.

Somewhat similar evidence was given in the other two cases. In those cases the "friend" or coach was a man, and again sums of £200 or £250 were mentioned.

Defence

Dr. Newton, in evidence, stated that he was 37 years of age and had practised at Teddington for ten years. He had 3,000 insurance patients and a large private practice, and his professional earnings for the last five years had been over £3,000 a year. The first of the three persons, A. B., came to him complaining of fainting attacks, and he treated him with luminal. He agreed that according to the entries in his diaries the time which elapsed from when he first saw the man until he gave the certificate was exactly four months, whereas he had said on the certificate that he had attended him for six months, and that he had been on luminal for five months, but he had written his certificate from memory. This patient was introduced to him by a Mr. Pell, an insurance agent, whom he had met socially and who told him that he had clients whom he would like him to see. He had no idea that A. B. had paid Mr. Pell £250; all that he received was three sums of 5s. each. The second man, E. F., was also introduced to him by Mr. Pell, and he examined him in Mr. Pell's bedroom in a London hotel. He found him suffering from loss of vision due to some lack of convergence, he was very nervous, complained of tingling in his legs, and had uncoordinated movements, and he thought the case was one of early disseminated sclerosis; he sent him to a consultant, who was also of that opinion. In the third case, I. J., he had known him for some years, but it was only in the early part of the war that he told him he was suffering from fainting fits and had had them for years. He asked him why he did not tell him earlier, and the man said that he did not like to disclose it. He prescribed luminal and epanutin. He had no knowledge of Miss Bentley and had never seen her.

Dr. Newton was closely cross-examined about the entries in his diaries; he admitted that he did not keep case-books. He said that he appreciated that the giving of a certificate which was to be used for the purposes of a medical board was a serious matter, but at the time—1940—it had not assumed the importance in his mind which it had since attained.

Each of the three "patients" was recalled, and all of them stated that before entering the Army they had driving licences and had signed the form stating that they had never suffered from fits or epilepsy.

Mr. Roberts, in a closing speech, said that the testimony in each of the three cases was uncorroborated. He was sure that the Council would not draw an unfavourable conclusion because in the practice of this busy doctor his defence was not supported by entries in his diaries. Dr. Newton had been used as the unconscious agent to further the designs of wicked men. The Council might be quite sure that the man who could deceive five doctors at the medical board would not leave anything undone to impress a doctor from whom he wanted to get a certificate. Some members of the Council might say, "Well, it all seems very suspicious, and very likely Pell or Miss Bentley (if those were their names), if they got £250, gave Dr. Newton his share of the 'swag.'" It was easy to say that, but the Council could not proceed to erasure on the strength of such a suspicion without evidence upon which to base it. So far as E. F. was concerned, no great swindle was practised by anybody. He was now only in Grade III, having been originally graded IV. As for I. J., this young swindler admittedly staged a fit in front of the doctor. If the doctor was in collusion with him, what need was there to do that? He was told what to do by this mysterious woman who flitted across the scene, and clearly neither of them relied on the doctor's dishonesty. I. J. was a good actor, for when he went to the medical board his condition appeared to be so deplorable that he was not asked to get out of the car. The Council should regard Dr. Newton as having been deceived, and evidently he was not alone in that respect.

After a session *in camera*, the President announced that the Council had found the complaint to have been proved, and directed the Registrar to erase Dr. Newton's name from the *Medical Register*.

Convictions for Misdemeanour

The Council considered the case of Dr. Christopher Bastible, registered as of Wexford, against whom a conviction in 1940 for being in charge of a motor car whilst under the influence of drink had been found proved at the session of November, 1941. Dr. Bastible had then been put on probation for one year, but on the case coming up for judgment at the present session a further conviction, in August last at Guildford, was mentioned, when Dr. Bastible had pleaded guilty of being drunk and incapable, and, on a later day, of driving a motor vehicle whilst disqualified.

The Council directed the Registrar to erase Dr. Bastible's name.

Correspondence

The Night-work Rota

SIR,—At the last A.R.M. meeting it was my duty to propose, on behalf of the City of London Division of the B.M.A., a resolution recommending Divisions to take the necessary steps to arrange for rotas for night work and for emergency work among practitioners. At the suggestion of Dr. Anderson, I agreed that the L.M.W.C.s be given this task in place of the Divisions, and the meeting passed the resolution accordingly.

Rightly or wrongly, I felt that I could not then say everything I wished to say, but I was surprised that nobody else made any objection to the resolution as it stood. And at a recent meeting of my own Division, when this problem was discussed, any criticism, given when asked for, was rejected with the assertion that the scheme would be voluntary, and that those who did not like it could stay outside. That, it seemed to me, was no valid reply to valid criticism, and I now ask you, Sir, to give some publicity to at least one voice.

Presuming that a rota is formed of, say, seven practitioners, each responsible for one night in the week, the scheme is superficially just, actually unjust. It favours him who through skill, luck, inheritance, or sheer financial shrewdness has a large panel; it penalizes the man with the small panel. The retort is made that the small-panel man, doing more night work within the scheme than he would do if he stood outside, would gain financially. But that is not the point. For a few pounds a year—only half of which would be borne by himself, the rest by the Income Tax Commissioners and the small-panel practitioners—the large-panel practitioner would have practically half his day (the night half) free from all responsibility, and be paid for it several times more than the small-panel man is paid! When it was suggested that this would be rectified by equality of sacrifice—the one doing, say, two nights' duty to one of the other, or, say, three nights to two—there was no response: specious Co-operation sat still, her tongue in her cheek.

Since I have mentioned panel practice it is not altogether irrelevant to refer to the objection the Insurance Committees made—and may still make, for all I know—to the calling up of men with large panel lists. The man with a large panel was "protected" by his committee: he was free to stay at home, his practice undisturbed, nay increased by additions from the "smaller" man's panel; for the "small" man had no protection: *he* went.

Surely, the minds that devised the imposing framework of the national insurance system, with its regulations and its clauses, its array of certificates of many colours, and its pedantic arraignment of many a doctor for infringement of the letter but not the spirit, could have devised a more equitable scheme! Verily, to him that hath much, much shall be given, but from him that hath little, that little shall be taken.—I am, etc.,

London, E.8. CHARLES SCHIFF.

B.M.A. AT WORK

Fuel for Consulting Rooms

The B.M.A. has drawn the attention of the Ministry of Fuel and Power to the special needs of doctors engaged in private practice for fuel to heat consulting and waiting rooms. The Ministry has replied that the supply position is so regulated that most essential requirements are met, and that although the maximum quantities which may be supplied, in general, are specified by the Ministry, the local fuel overseers have authority to grant licences for additional quantities whenever this is justified by special circumstances. If, however, the overseer should make an unreasonable decision the applicant may appeal to the regional coal officer, who has power to vary the overseer's ruling. It is hoped that this will be an adequate safeguard, but the Secretary of the B M A. will be glad to give any assistance possible to doctors who, having had occasion to appeal, are dissatisfied with the result.

The Panel Conference on the opening day of the meeting unanimously agreed that a congratulatory message should be sent to the Director of Medical Services, 8th Army. The following is the text of the message sent and of the reply which has just been received:

Telegram to Director of Medical Services, G.H.Q., Middle East

Annual Conference of Panel Committees representing all insurance practitioners in Great Britain assembled in British Medical Association House, London, expresses profound admiration and pride at the part played by the medical services in the Battle of Egypt and wishes Director-General and officers and men serving under him good fortune and continued prosperity in the future.—ANDERSON, Secretary.

Reply from Director of Medical Services, Middle East

Grateful your wire from members of Panel Conference expressing admiration and pride at part played by medical services and for your good wishes for future. Your message will be conveyed to all ranks in forward area and in base, who shared equally in results obtained. It will be highly appreciated.—TOMLINSON, Director, Med. Services, Mideast.

B.M.A.: Meetings of Branches and Divisions

NORTH OF ENGLAND BRANCH

At a meeting of the North of England Branch, held jointly with the Newcastle-upon-Tyne and Northern Counties Medical Society at Newcastle-upon-Tyne on Nov. 5, with Dr. F. W. GRANT in the chair, Dr. CHARLOTTE AUERBACH gave an address on "The Contribution of Genetics to Medicine." After referring to the high incidence of hereditary factors in disease, Dr. Auerbach discussed in some detail the general mode of transmission of incidence of familial disease in the descendants of parents with hereditary taints. The geneticist should attempt to assess the relative importance of heredity and environment in each specific case, in order that he might be in a position to assist in preventing transmission of the diseases by suggesting environmental changes to avoid predisposing factors. The lecture was preceded by a series of demonstrations by Dr. W. H. DICKINSON, Dr. H. J. SLADE, and Mr. NORMAN HODGSON.

B.M.A.: Branch and Division Meetings to be Held

GLASGOW AND WEST OF SCOTLAND BRANCH.—At Institution of Engineers and Shipbuilders in Scotland, 39, Elmbank Crescent, Glasgow, Wed, Dec. 9, 3 30 p m, Prof J. M. Mackintosh: Housing and Medicine.

PERTH BRANCH.—At Perth Royal Infirmary, Fri., Dec. 11, 3 20 p.m, Dr W T Munro. The Spread of the Tubercle Bacillus on Infection, and Its Relation to Disease in the Adult All members of H M Forces in area are invited to attend.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue

MARRIAGE

EGLIN—HOLDEN—On Nov. 14, 1942, at St. George's Parish Church, Stockport, Douglas Eglin, B Sc, M B, Ch B, of Leeds, to Betty Holden, L.R C.P., M.R.C.S., of Westhoughton.

DEATH

CHISHOLM—Missing, believed killed, as a result of enemy action at sea, William Chisholm, M.B, Ch.B, beloved husband of Fanny B. Chisholm (*née* Mackintosh), M D, D.P H., County Health Dept., Perth, and son of Mr. A. Chisholm, Caledon, Findhorn, Scotland Deeply regretted.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY DECEMBER 12 1942

GENERAL MEDICAL COUNCIL

DISCIPLINARY INQUIRIES

(Continued)

Alleged Improper Certification: A Charge Withdrawn

The Council considered the case of John Dwyer, registered as of Mitchelstown, Co. Cork, against whom it was alleged that he had given two certificates for use for administrative purposes under the National Service (Armed Forces) Acts in the case of a serving soldier stating that the man had been under his care for gastric trouble for about a month and was unfit to travel, whereas in fact he had not seen or examined the man until nearly the end of the period mentioned. Mr. Oswald Hempson, solicitor, who appeared for Dr. Dwyer, successfully submitted that there was no case to answer, for the simple reason that the man to whom the certificates had been given had never been identified. The President said that the legal assessor agreed with Mr. Hempson's contention, and the Council decided that the charge should be withdrawn.

Alleged Aid in Evasion of Service: Case Dismissed

The Council on Nov. 24 and 25 considered the case of Ali Ahmed Hoda, registered as of Walthamstow, M.B., B.S., 1920, University of Bombay, against whom the Ministry of Labour and National Service brought the complaint that in five cases he had given to men liable for Army service certificates stating that they were suffering from epilepsy, which were untrue, misleading, or improper, that he had conspired with them and other persons to enable them to evade their liabilities under the National Service (Armed Forces) Act, and that in four of the cases he had aided, abetted, counselled, or procured the man to produce in himself an apparent disability. Mr. Gerald Howard appeared for the complainants and Mr. Sandlands, K.C., for the respondent. The names of the men to whom the certificates were given were not mentioned. They were described as A. B., C. D., E. F., G. H., and I. J. When the case came for hearing, the charge relating to A. B. was dropped in the absence of the witness.

Mr. Howard, in opening the case with regard to C. D., said that this man had never in his life suffered from epilepsy or had any fits. Dr. Hoda was his family doctor and therefore ought to have known his state of health. Just before he was due to be registered under the National Service Act he went to Dr. Hoda and asked him to give him a certificate. Dr. Hoda certified that "he is in my opinion suffering from epilepsy. He has been under my care for the same for the last about ten years. . . ." Armed with that certificate C. D. went before the medical board and was put in Grade IV. Two months later he was re-boarded and put in Grade I. These occurrences took place in the middle of 1940, and Dr. Hoda had stated that all his records up to 1941 had been sent to salvage before any question was raised as to these cases.

C. D., in evidence, said that he was 28, and that Dr. Hoda had attended him since he was 14. He had never had epilepsy, but he had had occasional fainting attacks to which he paid no great attention. When he mentioned this to Dr. Hoda the latter told him he should see a consultant, and he went with Dr. Hoda to see Dr. L. R. Yealland, after which Dr. Hoda gave him the certificate. He was now in the Army, but graded II on account of scoliosis.

Dr. Hoda, in the witness box, said that he had 2,550 insurance patients and 600 or 800 private patients He first saw C. D. for these fainting fits ten years ago, and gave him phenobarbitone tablets and a bromide mixture. In his opinion he was suffering from epilepsy, and Dr. Yealland supported that view.

The following passage occurred in Dr. Hoda's cross-examination:

Do you keep any case notes?—None at all.

Not about anybody?—Not about anybody.

Do you not find yourself in a little difficulty? Supposing one of your patients developed symptoms which you thought required a specialist's advice, it is a little difficult without notes to tell the specialist about it?—The patient remembers the case to a certain extent.

Are you content for the specialist to have no professional assistance?—If you do not remember you ask the patient for his signs and symptoms over again and put it to the specialist.

Do you keep a record of medicine you have given to your patients?—No record.

Can you produce documentary evidence of the medicine you gave to C. D.?—None whatsoever.

If your diaries had been preserved they would have contained no mention of C. D.?—No.

He agreed that it would be true to say that unless a doctor actually saw a person in a fit he had to rely largely on what he was told. He had never seen C. D. in a fit, and stated that on the certificate. At the time he had 10 or 12 epileptics among his patients, about half of whom were liable to military service. Presently it came to his knowledge that some people had been questioned by the police about shamming epilepsy, and he thereupon gave no more certificates of the kind, but advised any who asked for them to go to the medical board and tell their own story. Asked for the reason why he sent these people to different consultants, he said that sometimes the patient wished for a particular consultant, though this did not apply in the case of C. D.

In addressing the Council on behalf of Dr. Hoda, Mr. Sandlands said that the charge rested on the uncorroborated evidence of a man who had desired to escape military service. It was no corroboration to say that he was afterwards graded I, for that might equally be the case on the supposition that Dr. Hoda had made an honest mistake, for which, of course, he would not have to appear before the Council. There was not a tittle of evidence of conspiracy. If there was any substance in these charges why did not the police prosecute Dr. Hoda at the time instead of, 2½ years later, asking the Council to do their work for them?

Mr. Howard said that C. D. was a man who to his own knowledge had never had epilepsy, and was never told by his doctor that he had, yet, when the time came for him to go before a medical board, he got a certificate from Dr. Hoda that he was suffering from that condition and had been treated by him for ten years.

It was here stated that the man E. F. was not available as a witness and the charge in respect to him was withdrawn.

G. H. gave evidence that he was 28 years of age, and had never had a fit. He did not mind going into the Army, but a relative was anxious that he should be exempted He asked Dr. Hoda for a certificate This was given in a sealed envelope, and he did not see it at the time, but it stated that he had been treated by him for petit mal for the last two years. He had never heard epilepsy mentioned in connexion with himself, but he thought he had heard Dr. Hoda mention petit mal on one occasion. He was put in Grade IV, but later, in consequence of a statement he made to the police, he was re-graded I, and now, owing to varicose veins, he was in Grade II.

Mr. Howard agreed that in the case of G. H. the symptoms he described might possibly be taken for petit mal, and that a *prima facie* case against the doctor had not been made out, and this charge was withdrawn.

The last witness was I. J., aged 29, to whom Dr. Hoda gave a certificate stating that he was suffering from grand mal and had been under his care for some considerable time. He said that he had a fit nine or ten years ago and was attended by Dr Hoda, who had been his family doctor for 18 years. Since then he had fainted "on and off," but had had no recurrence of that type of fit. In February or March, 1940, he met a man named Lipschitz, whom he introduced to Dr. Hoda as his uncle, and under Lipschitz's coaching he exaggerated his symptoms to give Dr. Hoda the impression that he had had a recurrence of his fit. He gave money to a third party to give to Lipschitz.

At the conclusion of this witness's evidence Mr. Sandlands submitted that there was no case to answer.

The Council found that the charges relating to C. D. and I. J. had not been proved to its satisfaction, and as the charges relating to A. B., E. F., and G. H. had been withdrawn, the case against Dr. Hoda was dismissed.

Charges of Misleading Certification

The General Medical Council devoted more than two days to the hearing of a complaint against Arthur Carr, registered as of Brick Lane, London, E.1, against whom it was alleged that in eight cases he had given untrue, misleading, or improper certificates in order to enable men to evade military service. Dr. Carr was defended by Mr. A Pereira, counsel, instructed by Le Brasseur and Oakley, solicitors, on behalf of the London and Counties Medical Protection Society.

Mr. Gerald Howard, counsel for the complainants, the Ministry of Labour and National Service, said that the eight cases covered the period October, 1939, to May, 1940. In three cases the men who received the certificates were put in touch with Dr. Carr by a woman known to them as Miss Brown, who was accompanied by an older woman passing as her mother. In four others they were put in touch by a man called Pomeroy, who was said to hold some position in premises in the same street as that in which Dr. Carr practised, and in the other case the intermediary was a man unknown. He was instructed that in Miss Brown's cases sums of £300, £350, and 300 guineas were paid to Miss Brown; in three of Pomeroy's cases £150 was paid, and in the fourth £130, and in the case of the man unknown £50. In every case the recipient of the certificate was said to have shammed symptoms of epilepsy before Dr. Carr, and the basis of the case against him was this, that whereas it might be possible for a doctor with the best intentions to be deceived once or even twice, these cases showed such a systematic course of conduct that it was impossible to believe that Dr Carr could have been deceived in them all. This was reinforced by certain significant circumstances. A number of these persons came from districts remote from Dr. Carr's practice—from North and North-West and Central London. There were converging upon Dr. Carr's surgery through devious channels during this period people from widely separated districts and people who, he thought without exception, were coming to see Dr. Carr for the first time. Another significant point was that in the majority of these cases the men were sent to specialists, most of them to different specialists What might be called a trade was carried on in the provision of certificates to enable people to evade their obligations. If Dr. Carr had exercised the most elementary caution, if he had made the most perfunctory inquiries, he must have come to the conclusion that something was being done which was patently wrong. In no case of the eight had the person concerned ever suffered from epilepsy in any form.

The evidence of the eight witnesses was then taken. They testified that they had attempted to evade military service by simulating epilepsy, with the result that they had been put in Grade IV by the Army medical board, and on re-examination had been put in Grade I or II.

In defence of Dr. Carr, who gave evidence on his own behalf, it was stated that he gave the certificates only after a very careful examination of the various persons and of their histories. In most or all of the cases he sent the persons to a specialist, and it was only after he received the specialist's report that his certificate was given. Asked why he chose so many different specialists, he replied that it was to the interest of the general practitioner to cultivate a number of specialists because this facilitated the admission of his patients to hospitals. His certificates were supported by the reports of the specialists The statements which he set out were statements of fact, and if the persons concerned, being liable for service, showed the certificate to a medical board, it was no responsibility of his. His certificates were given bona fide, and he had no idea that the persons had not been suffering from the complaints described.

The President pointed out that in this series of certificates Dr. Carr in every case had given the family history as a matter of fact.

Mr. Pereira on behalf of Dr Carr called three of the specialists to each of whom one of the cases had been referred by Dr. Carr. Dr. Bellingham Smith testified that he had seen one of these patients and was told his story by the relatives who accompanied him. They gave him a clear history of epilepsy, and the picture was a very complete one. On examination one could get very little from the "patient," who paid no attention to anything said to him. His deduction was that he was mentally deficient. If it was acting, it was very good acting. He came to the conclusion that the case must be labelled idiopathic epilepsy in a mentally deficient youth. He agreed that it was easy for a doctor to be deceived because the diagnosis of epilepsy was usually based on the patient's statements. He had no idea that the bringing of the case to him had anything to do with an application with regard to military service, and he would certainly have declined to give any form of certificate for anyone claiming epilepsy if he thought it was to be used to escape service.

Dr. Purdon Martin described his examination of another patient and the history of the case given to him by the man accompanying him, and said that as a result he came to the conclusion that it was a case of long-standing epilepsy with a good deal of mental deterioration. It did not cross his mind, considering the patient's apparent mental state, that special care was necessary in view of the fact that the man was going before a medical board. It would be incorrect to describe the patient, as Dr. Carr had done in his certificate, as being under his (Dr. Martin's) care.

Dr. Pearse Williams, the consultant who saw another of the patients, said that he had received a letter from Dr. Carr about him and obtained a history of the case from the man accompanying him, who was stated to be his brother. As a result, he had no doubt at the time about the condition of the patient. He would not consider it proper for his name and part of the letter he had written to Dr. Carr to be used by Dr. Carr in a certificate for the medical board, and as a consultant he would not consider that the patient was under his care.

Mr. Howard, in his speech on behalf of the complainants, submitted that the striking difference between the position of Dr. Carr and that of the consultants mentioned in the case was that whereas Dr. Carr knew that he was required to give a certificate for the purpose of a medical board, the consultants were not in that position at all, and they were fortified by the information which Dr. Carr had given them

The Council found that the facts had been proved and ordered the erasure of Dr. Carr's name from the *Register*.

The Council considered the case of William Lyle Paterson, registered as of W. Granton Road, Edinburgh, who was alleged to have improperly certified to the military authorities that a soldier's wife was in such a state of health that the soldier ought to be kept near home On a second charge Dr Paterson was alleged to have attended a patient when so far under the influence of drink as to be incapable of properly carrying out his duties. Dr. Paterson was not present nor was he represented. A statement was read from the soldier's wife in question to the effect that Dr. Paterson used to be her doctor but had not attended her for over a year Dr. Paterson's statement was that he visited the woman last May at the request of her husband, when he found her in a highly nervous condition. On the second charge a statutory declaration was made by a neighbour of the patient concerned to the effect that Dr. Paterson was drunk when he attended the case. Evidence was given by a member of the Edinburgh City Police as to the condition of Dr. Paterson when he found him in a public house after his attendance on the case in question; he formed the opinion that he was very much under the influence of drink. Dr. Paterson denied this completely, and he alleged antagonism on the part of a certain clique towards him.

The Council found the facts proved and directed Dr. Paterson's name to be erased.

The last of the certificate cases was that of Michael Murphy, registered as of Undercliffe Lane, Bradford, who, while in practice at St. Mary Cray, was alleged to have given a certificate stating that a police constable in the City of London Police War Reserve was suffering from gastro-enteritis and unable to follow his occupation, when in fact he did not make any proper professional inquiries before certifying. It was stated that the police constable was away from his duties under this certificate for a fortnight, but that on certain days during that time (Christmas) he was acting as a chorister at St. Paul's Cathedral. Mr. Oswald Hempson, who appeared for Dr. Murphy, said that he signed the certificate in good faith. If a patient, despite the orders of his doctor and the conditions attached to the certificate, disregarded those conditions the doctor was surely not responsible for this breach of conduct. He put in a statement from the patient to the effect that although ill he managed to go to the cathedral and attend evensong and then returned home.

The Council found the facts alleged against Dr. Murphy not proved to its satisfaction.

WEEKLY POSTGRADUATE DIARY

British Postgraduate Medical School, Ducane Road, W—*Daily*, 10 a m to 4 p.m., Medical Clinics, Surgical Clinics and Operations, Obstetric and Gynaecological Clinics and Operations *Daily*, 1.30 p.m, Post-mortems. *Mon.*, 2 p m., Ear, Nose, and Throat Clinic *Tues.*, 10 a m, Paediatric Clinic; 11 a m., Gynaecological Clinic; 2 p m., Genito-urinary Clinic. *Wed.*, 11.30 a.m, Medical Conference; 2 p m, Meningococcal Infection, by Lieut-Col. BIRTHS, MARRIAGES, & DEATHS

BIRTHS

Galley—On Nov 28, 1942, in London, the wife of Archibald H. Galley, M.B., B S., D A., a son

Jones—On Thursday, Nov 26, 1942, at Adlington Hall, Cheshire, to Jean, wife of A. Norman Jones, F R C.S., a son

Sutton.—Nov 3, 1942, at Ripley, Surrey, to Catherine, wife of Phillip Sutton, M B., B S, R A F.V R., of Great Yarmouth and Sidcup, a daughter (Anne Frances)

MARRIAGES

Brown—Howell—On Dec 1, 1942, at Gnoll Road Congregational Chapel, Neath, Surgeon Lieut Donald C. Brown, R.N V.R., only son of the late Mr and Mrs C. A Brown of Caerleon, to Dr Gweneth Howell, eldest daughter of Mr. and Mrs D. J. Howell, Bryn-y-Wawr, Seven Sisters

Martin—Muspratt.—On Oct 23, 1942, at St. Mary the Virgin's Church, Davyhulme, Manchester, Captain Robert Anthony Martin, R A.M C., son of Mr. and Mrs Robert Hall Martin of Irlam, to Joan Emerald, daughter of Mr. and Mrs Henry Muspratt of Davyhulme

Warren—Barnes.—On Nov 28, 1942, Harold Brian Seymour Warren, Lieut., R.A M.C, to Josephine Barnes, D M., F.R.C S, M.R.C O.G.

DEATH

Farncombe.—On Dec. 1, 1942, at the Royal Portsmouth Hospital, Harry Farncombe, M B., B S, aged 65 years, after a short illness.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY DECEMBER 19 1942

INSURANCE PRACTITIONERS' REMUNERATION

CASE FOR WARTIME INCREASE TO BE PRESSED

A meeting of the Insurance Acts Committee, which now consists of only 3 short of 50 members, was held at B.M.A. House on December 3. Dr. E. A. Gregg was re-elected chairman for the session. The principal business was the consideration of the many resolutions of the recent Panel Conference following the refusal of the Minister of Health to grant a wartime increase in remuneration to insurance practitioners. It will be recalled that the Conference passed a resolution instructing the committee to press for the reconsideration of the case by the Minister, and authorized it, in the event of further refusal, to take any action which it considered necessary, even to the extent of recommending practitioners to withdraw from the service. Following this decision a large number of motions and amendments were referred to the committee as offering possible methods of carrying out the instruction, and one of the tasks of the committee was to go carefully through these resolutions and decide which of them were for immediate adoption and which might be adopted in certain contingencies or not at all.

The Beveridge Report

A question which also arose in the course of the committee's discussions was the Beveridge report, which is likely to make the pace in the discussions concerning medical services for some months to come. The secretary of the committee (Dr. Hill) stated that Sir William was not concerned in his report with the detailed organization of medical services, despite the inclusion within his comprehensive social security proposals of medical services covering the entire community. But the question of the organization of medical services would now arise. In view of this, and also of the fact that the Minister, when receiving a deputation from the committee, mentioned that he was awaiting the Beveridge report and gave that as a reason for deferring any immediate action, the report was referred to the Executive Committee with a view to some recommendations being brought up at the next meeting of the full committee. There was also remitted to the Executive for consideration the body of resolutions adopted by the recent Conference which concerned the interim report of the Medical Planning Commission.

An End to Sectionalism

In considering the new approach to the Minister the chairman of the committee said that he had felt for some time that there was a weakness in the presentation of their case inasmuch as it was presented on behalf of a section of the profession. They would go with greater force to the Ministry if they spoke—as indeed they could—for the whole profession, which was concerned to see that proper conditions were ensured to every section of it. He suggested that the next approach be made not by the Insurance Acts Committee as such, but by the Council of the British Medical Association, and that any outstanding people in medicine who were not members of the Association should be invited. It was the whole profession who should speak on such a matter as this. He wanted to get rid of the adjective "panel" or "insurance" as qualifying the term "practitioner."

This view met with the approval of the committee, and Dr. Gregg was authorized to bring it before the Council of the Association.

Post-war Bonds

After a long discussion of various alternatives, the committee agreed on a course of action which may be set out generally as follows: to go again to the Minister with the weight behind them of the vote of the Panel Conference as indicative of the temper of the men carrying out the service and ask for a reconsideration of the case for a wartime increase on the main ground of the shift of insurance risk which operated greatly to the disadvantage of the doctor. On this question and related questions regarding the increased work and obligations and harassment of the practitioner now as compared with the pre-war period the committee would be prepared to accept arbitration should the Minister offer it. In view, however, of the attitude taken by the Minister on the former approach, that it was against the policy of the Government in wartime to grant such increases, the committee agreed that they should urge that if recognition of extra services and responsibilities could not be granted in the form of an immediate addition to the fee, it should be granted in the form of bonds redeemable after the war. The Government had adopted the principle of deferred pay and post-war credits in other spheres, and this seemed to be a proper field for its application.

The committee also considered other matters which might be brought to the attention of the Minister, including the case of practitioners who were exceptionally hardly hit because they practised in coastal or evacuation areas, where they had to remain to afford necessary medical service for the residue of the population. A further point to be brought to the attention of the Minister was the great increase in the amount of minor illness among the insured population, due to the stress of war conditions and particularly to the disregard of the optimum number of working hours and to night work.

The committee dealt with a large volume of other business arising from the Annual Conference.

NATIONAL INSURANCE DEFENCE TRUST

As Trustees of the Fund the committee considered the expression of opinion on the part of the Conference that the Defence Fund, now standing at about a quarter of a million, should have its "ceiling" raised to one million pounds. It was also urged in some quarters of the committee that in addition to providing for the eventualities which were in mind when the Fund was originated, its income might be used to promote the return of a medical Member of Parliament who would devote himself particularly to questions in connexion with the insurance medical service. Some discussion took place as to whether the new target should be half a million or a million, but the Trustees decided on the larger figure. They agreed not to recommend an increased rate of deduction, the new contributions to be made at the rate hitherto obtaining. Panel Committees will be circularized concerning their enlarged quota.

The Trustees also considered the question of the grants which are made from the Fund to facilitate the retirement of practitioners against whom, owing to age or infirmity, some complaint has arisen or is likely to arise. There has been a tendency for these grants to have a charitable purpose instead of the purpose which the Trustees had originally in mind, and there are, of course, medical benevolent funds from which necessitous cases can be helped. It was agreed by the Trustees to make no further awards of this kind and to recommend to the Conference to rescind the resolution of 1938 approving allocations from the Fund for the financial assistance of such practitioners, but it was expressly laid down that this will affect only new applications, not cases in which grants are already being paid.

The British Medical Students Association—at one time a faculty subcommittee of the National Union of Students and representative of only two London medical schools besides provincial ones, but now an independent organization which speaks for medical students throughout the country—held its inaugural meeting at B.M.A. House, London. Amendments to the constitution and the forms of agreement with B.M.A. and N.U.S., through which the association hopes to keep in touch with the medical profession and the general body of students, occupied the first session. At the second a committee was elected to complete the memoranda on reform of the medical curriculum, which had been requested by the Medical Planning Commission, and on certain specific aspects of the curriculum, which had been asked for by the Minister of Health. Discussion followed on the proposed shortening of the curriculum, and then the meeting turned to the subject of student health, a subcommittee being appointed to discuss this problem with the N.U.S. Among other matters was the position of women in medicine.

THE B.M.A. AND PUBLIC HEALTH

Compensation for Medical Officers on Civil Defence

The Public Health Committee of the B.M.A. met on November 18, when a number of new members were introduced. The committee consists of 20 members, including 2 nominated by the Society of Medical Officers of Health. Professor R. M. F. Picken was again unanimously re-elected to the chair. The agenda comprised 26 closely typed pages of foolscap.

A matter which was considered at length was the compensation of public health medical officers for injuries sustained while on A.R.P. duties. The Association has for some time been concerned over the position of officers who are whole-time members of the local authority staffs and are injured in the course of their civil defence duties in circumstances which are not the direct result of enemy action or other warlike operations. These officers technically are not persons who become members of a civil defence organization maintained by the local authority and whose civil defence duties arise solely out of such membership; they are regular local authority employees who are regarded as not generally eligible for compensation on the higher scale because any injury arising out of the performance of their duties is liable to be dealt with from the point of view of their permanent employment under the local authority.

On the other hand, it has been represented to the Ministry of Home Security that medical officers of local authorities have in many cases been nominated to carry out civil defence duties by virtue of their position. At first the supervisory officers were not expected to go out on dangerous occasions, but in practice it was found impossible in many cases for them not to do so. The medical officer of health who suffers injury other than a "war injury" in his civil defence duties might have to suffer a total or permanent loss of income, for he is excluded from the scope of the Workmen's Compensation Act, and he receives no pension if his service is of less than 10 years' duration, nor is there provision for compensating his widow or dependants should he be killed in the performance of civil defence duties.

The Association, in its correspondence with the Ministry, has maintained the obvious principle that there is a distinction between a medical officer of health employed on his normal peacetime duties and the same officer holding a key position in civil defence in wartime. It seems impossible, however, to bring this home to Whitehall, and these men who have to take unusual risks in connexion with their new duties are left to the mercies of their councils should injury be incurred. No doubt in many cases those mercies would be tender, but not all councils can be depended on to take a generous view.

The Public Health Committee agreed that the Ministry should be asked for a specific reply to the question whether, if a local authority expected its officers and administrators in supervisory positions—for the same thing applies to town clerks and borough engineers and county surveyors—to go out and take special risks, they could be included in the enrolment for the civil defence services, which would entitle them to compensation on the higher scale. It was also agreed to get in touch with the National Association of Local Government Officers.

Wartime Increases in Remuneration

The question of asking for a wartime increase on behalf of members of the public health service was discussed. It was mentioned that the Society of Medical Officers of Health had collected resolutions and observations from its branches and groups, and that its council after considering these reports had decided that no demand for the revision of salaries should be made at the present time, but that any war bonus awarded to the staffs of local authorities should be extended to all medical officers, whole-time or part-time. The Public Health Committee concurred in this view so far as whole-time medical officers were concerned, but with regard to part-time officers it had before it a question from the Medical Women's Federation whether the sessional fee of one and a half guineas was now adequate for work in public health clinics, and a resolution of the Annual Representative Meeting asking Council to consider whether a new scale of minimum fees should be laid down for all part-time work for public authorities, Government Departments, and societies. About a year ago local authorities were circularized on the subject of increases of salary for part-time officers, with moderate success in the case of part-time D.M.O.s, but less success in the case of others.

The committee's recommendation was that appropriate quarters be approached with a view to an increase of 20% on fees for public health medical work paid on a sessional or case basis.

Supplementary Pensioners and Public Assistance Medical Service

The honorary secretary of one of the Divisions of the B.M.A. wrote that he was receiving complaints from doctors about a new procedure whereby officials of the Assistance Board visited people to investigate their need for supplementary pensions, and if the pension was granted, told them that they were entitled to the free service of a doctor, and this was followed by a card from the public assistance committee giving them the name of the doctor of the district. The Ministry of Health had been asked whether a local authority was acting properly in allowing a relieving officer automatically to place the names of supplementary pensioners on the medical relief list, to which it replied that it was for the county council to decide what investigation, if any, was necessary into each individual application for inclusion in the list, but the council might properly decide that no further investigation than that already made by the officers of the Assistance Board was necessary.

It was stated in the committee that it was clear that these people were entitled to this service if they did not come within the medical benefit of the Insurance Acts. The legal issue had been raised as to whether it was proper for an authority to allow relieving officers to enter names on the list without specific sanction, and counsel's opinion was that in each case the application must be considered by the appropriate committee of the council. But this obviously would not preclude the relieving officer from placing the name on the list for immediate attention and afterwards getting his action approved by his committee. To undermine the Act or attempt in any way to conceal its provisions was quite out of the question. But if there was a substantial increase in the amount of work falling on public assistance medical officers the Association should by all means support an application for a corresponding increase of remuneration. These views were endorsed by the committee.

GENERAL MEDICAL COUNCIL

(*Conclusion*)

Education Inquiries

The recent session of the General Medical Council was almost entirely occupied with disciplinary business, but Dr. H. L. Tidy stated that at the previous session two subcommittees were appointed, one, under the chairmanship of Dr. Brocklehurst, to consider an inquiry from the Departmental Committee on Curriculum and Examinations, and the other, under the chairmanship of Sir Farquhar Buzzard, to consider an inquiry from the Interdepartmental Committee on Medical Schools, generally known as the Goodenough Committee. Both Dr. Brocklehurst and Sir Farquhar Buzzard had prepared memorandums on these subjects which, after consultation with their subcommittees, were placed before the Education and Examination Committees of the Council. They had now been redrafted as evidence to be submitted. On the suggestion of the President, the consideration of the memorandum for the Goodenough Committee was postponed until the next meeting of the Council.

DISCIPLINARY INQUIRIES (*concluded*)

Alleged Professional Relationship in Adultery

The Council considered the case of William Faulkner Valentine Simpson, registered care of an address in Parliament Street, London, who had been summoned on the charge that he had committed adultery with one Mary Purvis, of which adultery he had been found guilty by decree of the Divorce Court in a case in which he was the respondent, and that he was in professional relationship with Miss Purvis at all material times. Dr. Simpson did not attend nor was he represented.

The Council's solicitor, Mr. Winterbotham, put in certain documents, including the death certificate of the father of Miss Purvis, which showed that Dr. Simpson was medical attendant (that was in 1926), and a certificate relating to treatment, dated 1927, which was said to refer to Miss Purvis, but which Dr. Simpson in a letter stated to refer to her mother. Four pocket diaries for the years 1934 onwards were also put in, containing entries of the name of Purvis. Mrs. Dorothy Simpson, in evidence, declared that Miss Purvis, who was co-respondent in the divorce action against her husband, was always her husband's patient Dr. Simpson wrote denying that he ever had relations with Miss Purvis while he was her medical attendant He had not attended her professionally for over seven years previous to the matters alleged in his wife's petition.

The Council found that the facts alleged against Dr. Simpson had not been proved to its satisfaction.

Misdemeanours

Hugh McNicholl, registered as of High Road, Mottingham, S.E., was summoned on the charge of having been convicted in 1939 at Woolwich of driving a motor car whilst under the influence of drink, and in 1942 at the London Sessions of a similar offence. The convictions were proved, but judgment was postponed for twelve months.

The Council also considered the case of John Gerard Cunningham, registered as of Crossmaglen, Co. Armagh, who was summoned on the charge that he had been convicted in 1938 of being in charge of a motor vehicle whilst under the influence of drink, and in 1941, when he was a lieutenant in the R.A.M.C., had been found guilty by a court martial of being drunk on active service and sentenced to be dismissed from H.M. Service. Mr. Oswald Hempson, defending on behalf of the Medical Defence Union, urged the youth of his client—he was under thirty years of age—and the fact that when the Army offence was committed he was stationed at a detached post several miles away from the mess, and, unwisely, on going to a dance he had a number of drinks. Testimonials to the excellence of his work were put in.

The Council did not see fit to direct the Registrar to erase Dr. Cunningham's name.

The sitting of the Council lasted for five full days. Three cases were postponed to a subsequent session, which it is understood will be held in the early part of next year.

Correspondence

Milk Distribution

SIR,—At a meeting of the executive committee of the Croydon Division of the B.M.A. the question of milk supplies was fully discussed. Concern was felt at the extraordinarily large quantities of milk that are obtainable for nursing mothers and children under 1 year in the form of fresh milk, dried milk, and proprietary foods purchased at chemists, the total quantity obtained in a large number of cases being far in excess of peacetime purchases. It is not desired to curtail the official allowance for such persons, but it should not be possible to obtain the full official allowance in fresh milk, dried milk, and proprietary milk foods.

If the excessive amount of milk consumed in many of the homes of persons with young children were officially controlled, it would afford a sufficient saving of milk to help meet the great hardship to persons over the age of 70. Although consideration should be shown to those on whom will fall the task of maintaining the country in the future, such consideration should not entail hardship on those who have performed the same task in the past.—We are, etc.,

DOROTHY DAY,
Chairman.
S. ALEC FORBES,
Hon. Secretary.

Croydon.

Planning and Action

SIR,—I am writing to ask whether you know how fast—or how slowly—the B.M.A. is making its plans for the medical service of the future. It is, of course, obvious that the fully planned State service that is to come cannot immediately be put into operation, since buildings for health centres and the like have to give way for the present to war factories; man- and woman-power is not now available for the administrative staffing. That we realize. But the Beveridge report has poured oil on to a fire that has so far only glowed, and it seems to me that events will move very fast. Does the B.M.A. realize the need for acting quickly? Has it made any plans which can be put into operation soon, and which can be used as a basis for the complete post-war reconstruction? Does the B.M.A. realize—and doctors generally—the urgent need that *we*, the medical profession, must run any new scheme if it is to be a success? Do they realize that unless we pull together we shall be in the nature of a burnt offering to other more organized interests?

I have read many articles and letters in the *Journal*, which is supposed to represent us, but I have never yet read anything that has been in the nature of a trumpet call to the profession as a whole: a call to wake us up, to rouse us from our apathy and self-interest: a call to arms. It is still a peaceful rather sleepy paper in times when things are beginning to move fast, when great principles are at stake. Is there no one among us who will come up to the measure of these times and quicken the spirit that I am sure is in us?

We cannot, I am sure, compromise this time. We are being driven by the war against a wall from which we can either fight our way out to something great or else we go under and become panel doctors, run by Civil servants. Could anything be worse?—I am, etc.,

Ledbury. GEOFFREY G. AIREY.

BRITISH MEDICAL ASSOCIATION

Radiologists Group Committee

The following have been elected members of the Radiologists Group Committee of the B.M.A. for the three years 1942-5: Dr M. H. Jupe (London, W.1), Dr. R. Boulton Myles (Worthing), Dr. Ralston Paterson (Manchester), Dr. R. E. Roberts (Liverpool), Dr. S. Cochrane Shanks (London, W.1), and Dr. C. G. Teall (Birmingham)

Meetings of Branches and Divisions

NORTH OF ENGLAND BRANCH

Meetings of the North of England Branch were held jointly with the Newcastle and Northern Counties Medical Society at Newcastle-upon-Tyne on Oct. 15, 22, and 29. At the first, at which Dr. MONA MACNAUGHTON took the chair, Prof. J. R. LEARMONTH gave an address on "The Diagnosis and Treatment of Peripheral Vascular Disease." At the second, when Dr. T. S. BLAIKLOCK presided, Prof. E. FARQUHAR MURRAY spoke on "The Present-day Attitude towards Certain Gynaecological Problems." Discussing treatment of carcinoma of the uterine cervix, Prof. Murray said that while in the majority of cases radium therapy was more satisfactory for general use he had performed a Wertheim hysterectomy after radium application in a few early cases, and, in his considered opinion, this materially improved the prognosis. On Oct. 29, with Dr. P. V. ANDERSON in the chair, Dr. J. A. CHARLES gave an address on "New Fields in Preventive Medicine." Dr. Charles described pulmonary tuberculosis, diabetes, and prematurity as three fields in which preventive medicine sought to establish new interests and to foster new endeavours. The common purpose was the same in each case—namely, to prolong human life and combine increased length of days with happy and useful occupation. Sweeping changes were necessary to ensure that early diagnosis and prompt and effective treatment of the tuberculous person became the rule, and that, in the quiescent stage, a diminished strength was employed to good purpose without detriment to the patient. Efforts should be made to extend the days of the diabetic to their full normal expectation of usefulness and activity; and for premature babies, for whom a whole lifetime depended upon the doctor's efforts, the free services of consulting paediatricians supported by specially trained nursing teams with proper hospital facilities should be made available.

Before each lecture there were demonstrations of clinical cases by Mr. JOHN GILMOUR, Mr. G. F. ROWBOTHAM, Dr. GEORGE DAVIDSON, Dr. A. G. OGILVIE, Mr. W GRANT WAUGH, Mr. STEWART FAGGETTER, Mr. J. S. ARKLE, Mr. A. MACRAE, Dr. E. F DAWSON-WALKER, Dr. G. HURRELL, and Dr. IAN E. MCCRACKEN.

The North of England Branch held meetings jointly with the Newcastle-upon-Tyne and Northern Counties Medical Society on Nov 12 and 19. Dr. B. B. NOBLE presided at the former, when Prof. J. LE F. BURROW gave an address on "Problems of Minor Medical Illness: Diagnosis and Treatment." He defined fibrositis as a non-suppurative inflammatory condition of connective tissue, which might be either general or local in distribution. Discussing treatment he emphasized that, while massage and movement were beneficial in certain cases, complete rest, enforced when necessary by splinting, was essential in acute cases. He referred to the efficacy of local injections of glucose-saline–novocain solution into areas containing nodules.

The lecture was preceded by demonstrations by Dr. C. N. ARMSTRONG, Dr. A. A. McINTOSH NICOL, and Mr JOHN BRUMWELL.

At the second meeting Dr. MONA MACNAUGHTON took the chair, and Prof F. C. PYBUS spoke on "Recent Advances in Cancer Research." Before the lecture there were demonstrations by Prof. F. J. NATTRASS and Dr. WILLIAM HUNTER.

SOUTHERN BRANCH: ISLE OF WIGHT DIVISION

At the annual general meeting of the Isle of Wight Division the following officers were elected for the ensuing year: *Chairman, Representative in Representative Body, and Honorary Treasurer,* Dr. H. S. Howie Wood. *Vice-Chairman,* Dr. J Dockray. *Honorary Secretary,* Dr. Balfour.

Mr. O'DONOGHUE paid a tribute to the work done for the Division as honorary secretary and for the Association by Dr HOWIE WOOD, and the latter, in occupying the chair, thanked Mr. O'Donoghue for his good work during his year of office.

A meeting of the division, to which all practitioners and the island nursing profession had been invited, was held at Newport, with Dr. HOWIE WOOD in the chair. Surgeon Rear-Admiral CECIL P. G. WAKELEY gave an interesting lecture, illustrated by lantern slides, on "Head Injuries, with Special Reference to War Conditions."

H.M. Forces Appointments

ROYAL NAVY

Surg Cmdr A J. Tozer has been placed on the retired list with the rank of Surg Capt

Surg. Lieut (Emergency) N. S. Hepburn to be Surg. Lieut-Cmdr (Emergency)

Surg Lieut D Martyn has been transferred to the Emergency List

ROYAL NAVAL VOLUNTEER RESERVE

E E Henderson has been re-entered as Surg Lieut-Cmdr.

Acting Surg Lieut-Cmdrs P. de B Turtle and J L Holgate to be Surg Lieut-Cmdrs

Prob Temp Surg Lieuts. M Wickham, L. P Davies, W. M. Wilson, J Alexander, G Krafft, P. Greenstreet, M Watkins, J R Tiller, and A H Staples to be Temp. Surg Lieuts

ARMY

The following Consultants, War Subs Lieut-Cols (Temp Cols.), have been granted the local rank of Brig: G Masne, H L Marriott

Lieut-Col A Hendry, R.A M C (ret.), has reverted to the rank of Major at his own request whilst employed during the present emergency

ROYAL ARMY MEDICAL CORPS

Lieut-Col W. E. Adam, M C, has retired on retired pay on account of ill-health

Temporary Commissions—War Subs Capts E. R D Eastman-Nagle and A Cathcart have relinquished their commissions and are granted the rank of Major.

Short Service Commissions—To be Lieuts (on probation) P. J C. Burton and J F N C Ward-McQuaid

REGULAR ARMY RESERVE OF OFFICERS

The following Cols, having attained the age limit of liability to recall, have ceased to belong to the Reserve of Officers P. J Hanafin, D S.O., late R A M C, and R. P. Lewis, D S O., late R.A.M C

ROYAL ARMY MEDICAL CORPS

Capt H Mitchell to be Brevet Major under the provisions of Article 168, Royal Warrant for Pay and Promotion, 1940

TERRITORIAL ARMY, R A M C.

Capt J W Keighley has relinquished his commission on account of ill-health and retains his rank

TERRITORIAL ARMY RESERVE OF OFFICERS, R A M C

Major F D Marsh, M C, has ceased to belong to the T A R O. on account of ill-health

LAND FORCES. EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs Capts [illegible] J Spira, A S Torrance, and P T Northover have relinquished their commissions on account of ill-health and are granted the rank of Capt

Capt. A. Thomson has resigned his commission.

Lieut. I. Robins has relinquished his commission on appointment to a commission in the S A M.C.

Lieuts. I. T. F. Wiley, B. W. Smith, R. K. Nandlal, C Seager, and H Barron have relinquished their commissions on account of ill-health and retain their rank.

A C F Section.—2nd Lieut B G T. Elmes, from General List, to be Lieut

Flying Officer H. Avery has relinquished his commission on account of ill-health and retains his rank

Flying Officer T. K Haran has resigned his commission.

R A F.V R. DENTAL BRANCH

J. C Smith, M B, Ch B, to be Flying Officer (Emergency)

INDIAN MEDICAL SERVICE

EMERGENCY COMMISSIONS

To be Lieuts (on probation): Helen M Herbert, Jean M. R. M Johnson, Eugene N Pearlman, Nora K Woll, Gwendolen M. Higgins, and Edith H Smith

APPOINTMENTS

JAIDKA, K. C., F R C S Ed, full-time Surgeon, Peterborough and District Memorial Hospital

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue

BIRTH

BAIN.—At Johnstone House, Belfast, on Nov. 30, to Major A J. Bain, R A M C, and Mrs Bain, a son

MARRIAGE

BIRNIE—VALENTINE.—At the Church of Scotland, Crown Court, London, on Dec 12, 1942, by the Rev J Moffett, B A, Flying Officer William Birnie, M B, Ch B, R A F.V.R, second son of the late Mr William Birnie and Mrs. Birnie, Peterhead, Aberdeenshire, to Assistant Section Officer Emma Irene Valentine, W.A A F., second daughter of Mr and Mrs. A S Valentine, 18, Queen's Road, Barnet, Herts.

DEATH

CRAWFORD.—On Dec 9, 1942, at 45, Mount Park Road. Lt-Col D. G Crawford, I.M S. (ret.), aged 85.

The Home Secretary announces that Dr R. M. Geldart of Worthing and Dr. B. J. Barnett of Birmingham are no longer authorized persons for the purposes of the Dangerous Drugs Regulations.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

LONDON SATURDAY DECEMBER 26 1942

FREE CHOICE OF DOCTOR AND CERTIFICATION

BY

B. BUCKLEY SHARP, M.D., M.R.C.P., D.P.M.

War accelerates social evolution, and proposals for a national health service are being freely circulated. The various proposers seem to be up against the problem of evolving a workable scheme in which there shall be no direct money contract between patient and doctor but yet some degree of free choice of doctor by patient and of patient by doctor. Whatever lip service is paid to this principle, it cannot be achieved in practice. Whenever a service is taken over, organized, and paid for by society as a whole (the State) the individuals lose their power to choose. The report of the Medical Planning Commission envisages a group of doctors based on a health centre, each doctor accepting direct applications from patients up to a certain number, and then closing his list. He may refuse to accept any person he does not desire to attend. The "also-rans" on both sides will have to take what they are given.

To the majority of the public to-day free choice of doctor seems to mean little. Most panel patients from whom I inquire the name of their panel doctor do not know it, or, if they know it, as often as not when seeking attention are seen by some other doctor with whom they are unacquainted who is "sitting" at the surgery that day (presumably an assistant or partner), and they make no bones about it. Well over 90% of sick persons in whom there is, or is thought to be, something seriously wrong attend a hospital or clinic, and "accept with complacency, if not with gratitude, the services of any doctor who chances to turn up." The tendency of doctors to form partnerships, often with several members, makes it often impossible even for private patients to be sure who will arrive when they send for help urgently or in the night.

Analogy of the Education Service

There can be free choice in full measure only when a direct contract is made between doctor and patient without the intervention of a "middle man" such as a Government Department. By all means let this option continue with or without the special facilities of a provident scheme. Let there also be a national health service, including consultant and hospital provision, to which all shall contribute, of which all may avail themselves if they wish, and in which there is *no* freedom of choice of individual doctor by patient and of individual patient by doctor. The doctor should be permitted to elect from time to time to what extent he will participate, whether he is prepared to accept a full quota on his list, only a proportion of the maximum allocation, or none at all. and should be remunerated *pro rata*. Everyone, for example, contributes to education, but not all are bound to accept State education for their children.

The next question is whether free choice of doctor is desirable and in the best interests of the public. The answer would seem to be "*no*" without certain safeguards. A strong argument can be adduced on the psychological side that the favourable outcome of illness depends much on faith and on the rapport between doctor and patient, and that a negative transference stultifies treatment. One must admit the truth of this in varying degrees. But on the other side it must be recognized that the question of gain may play an important part in choice of doctor, and that society should be protected against being taken advantage of and against waste by unjustified prolongation of invalidism. A letter signed "A.B." in the *Lancet* of June 27, 1942 (p. 777) says "it is arguable that free choice of medical attendant and liberty to change him cannot possibly continue when, sooner or later, more generous sick pay becomes obtainable," and the conflict of loyalties would impose too great a strain on the doctor in certification unless he were either a State official or released from the task of certification. But this problem is not new and does not depend on possible increase in sick pay in the future; it has been with us for years.

Gain Motif in Certification

A correspondent in the *Lancet* of November 22, 1941 (p. 649) outlined a hypothetical day in the life of a general practitioner in which he signed 35 different kinds of certificate (he did not pretend that this was an exhaustive list). Of these a number enabled the applicant to obtain something in cash or in kind from his fellows or to escape a distasteful duty to society—e.g., (1) panel certificates, including certain special benefits; (2) certificates of total or partial incapacity under the Workmen's Compensation Act; (3) certificates for convalescent treatment wholly or partly at the public expense; (4) certificates to obtain extra rationed food; (5) certificates of unfitness for fire-watching or factory work. The last two are a product of the war, and it is noteworthy that the Government have thought fit to lay down in specific terms the circumstances in which certificates under (4) may be issued by medical practitioners. This is a great relief to the doctors, and the reason is obvious. But for these rules the milk and egg rationing schemes would be wrecked by a flood of documents certifying that nearly everyone required additional rations of these foodstuffs. It is also of interest that where loss of civil rights is concerned the Law of Lunacy stipulates that an independent certificate shall be given by a practitioner unconnected in business with the regular medical attendant and deriving no benefit by certification.

Doctors are but human and, in the main, have their actions determined and modified by motive as have others. Motive is complex, and acts at various levels of consciousness from full consciousness to complete unawareness. When awareness is dim or absent a person is prone to attribute his actions to motives that satisfy his conscience and save his face, and not to the prime underlying motive that may be less respectable. So long as the financial rewards of medicine are on the *à la carte* basis a doctor has to satisfy his "clients" in order to prosper or even to enjoy a reasonable standard of existence. This applies to both private and panel practice in any area where there is competition, and there must be few, if any, where there is not. The professional attributes most likely to lead to wide patronage and thus prosperity are an air of omniscience combined with a certain dogmatism, a sympathetic attitude to the patient and his complaints, and last, but not least, an uncritical readiness to issue certificates for the patient's material benefit.

When issuing certificates of the kind referred to a doctor is acting as custodian on behalf of the society in which he lives, but is, at the same time, in the improper position of affecting his own interests by certifying or refusing to certify at the request of the patient. He is like a judge who has an interest in the result of a case which he is called upon to try. He will react to this situation in one of two ways. Most commonly his professional judgment will be subject to a conscious, partially conscious, or unconscious bias in favour of issuing the certificate; or, if he has an obsessional over-conscientious personality, his professional judgment will be subject to a bias in the opposite direction. The former reaction is the more frequent. This mechanism is often observable in questions of conflict over personal injury, the contestants being an individual on the one hand, and society on the other as represented by another individual or group of individuals. Here doctors of more or less and often of approximately equal knowledge and ability will be found on opposite sides giving widely divergent opinions on aetiology and prognosis, whereas if they were in consultation over the same case in non-controversial circumstances the odds are that their views would vary very little, if at all. All this is very bad for the patient's attitude towards himself and may create, aggravate, or perpetuate invalidism.

Failure of a Social Experiment

Although the present panel system is not blameless, the most outstanding examples of certification influenced by motive are seen in the application of the Workmen's Compensation Act. Here incapacity, total or partial, for earning wages results, while it lasts, in maintenance of the workman by society as represented by his employers, and may result, if persistent, in the receipt of a lump sum in settlement by way of commutation of weekly payments. Certification influenced by motive is prone to appear on both sides—optimism on the side of society as represented by the employer, whose appointed referee is impelled to satisfy, so far as possible, the employer, and pessimism on the side of the workman, whose doctor is impelled to "do his best for his patient," thereby at the same time enhancing his local reputation as the right kind of doctor to go to. Hence the Workmen's Compensation Act has gained its title as a failed social experiment. Evidence in support of its failure is frequently forthcoming. McAusland (*Journal*, May 2, p. 566) blames many panel doctors for factory absenteeism on the ground that they discourage workers from resuming work, after they have been discharged from hospitals as fit, by weekly certificates of incapacity to the effect that they are "still suffering from the effects of injury." The responsibility that rests on the workman's doctor and the regrettable results of his frequent faulty handling of the situation (no doubt with what he consciously regards as the best intentions) were well brought out in the "Discussion on the Workmen's Compensation Act as a Factor in Prolonging Invalidism" held at the Royal Society of Medicine on May 5 last.

If free choice of doctor in whole or in part is preserved, the solution to the problem of this kind of certification appears to be that certificates upon which gain or loss depends shall only be issued by doctors who are entirely disinterested and independent, and who possess a high standard of knowledge and experience. Such doctors should be appointed by the State for this purpose on the lines adopted for dealing with scheduled industrial diseases. It will be contended, no doubt, that this proposal is the negation of freedom, and that a person having the right to select his own medical attendant shall also have the right to obtain certificates from the doctor "who knows his case." The term "freedom," however, while often adduced to make a case, is not precise enough to support an argument. It is axiomatic that in no social system can complete freedom exist; there can only be degrees of freedom. The freedom which we cherish is a limited right to do the work we select where we like, to enjoy ourselves in any innocuous way we like, and, above all, to think as we like and speak as we like provided that what we say is not treasonable, blasphemous, obscene, or likely to produce a breach of the peace. But where we have to depend on the help and support of society as a whole, and reciprocate in our turn in helping and supporting society, there cannot be individual freedom.

CERTIFICATES FOR PROPRIETARY PRODUCTS

It has been brought to the notice of the B.M.A. that certain manufacturers of proprietary articles, including food products, are issuing prescription forms for doctors to sign with a view to facilitating the purchase of these articles by patients. It should be appreciated that a doctor is under no obligation to make use of any such form and is not expected to do so.

NATIONAL EYE SERVICE: OPHTHALMIC MEDICAL EXAMINATIONS

At the first meeting of the newly constituted Ophthalmic Group Committee of the B.M.A. on December 3 Dr. O. G. Morgan of London was elected chairman and Mr. George Black of Leeds vice-chairman. The committee, which now consists of 17 members and 4 observers, received a report on the work of the National Ophthalmic Treatment Board for the past year.

It carefully considered the analysis of the results of the recent questionary with regard to the fee for ophthalmic medical examination in the National Eye Service and the observations which a number of ophthalmic medical practitioners had included with their replies. The general feeling appeared to be that a good and strengthened National Eye Service should by all means be secured, but at the same time there was no desire to get higher fees from the poorer section of the community. The general principle at stake was regarded as of more importance than the addition of a few shillings to the half-guinea fee. One member of the committee drew attention to what had been done in Eire, which, he suggested, might be a model here. There a National Health Insurance Society covered all insured persons. The opticians entered into an agreement not to publish any notice or advertisement to the effect that they had entered into an agreement with the society, and applicants for optical benefit were told that it was necessary for them to have their eyes examined by an ophthalmic surgeon and to obtain a prescription from him before going to the optician.

After further discussion members of the committee were reminded of the extreme probability that within a comparatively short time the Beveridge or some other far-reaching proposals might bring about a large reorganization of the medical services of the country. This opened the question whether it was desirable at the present stage to propose a change in the conditions attaching to the National Eye Service. In the shaping of things to come the ophthalmic surgeon would probably be in no different position from any other specialist in an all-embracing set of provisions. In view of these changes it might be sufficient to agree to such a modest increase on the existing fee as the 20% so generally taken in other connexions. So far as insured persons of the higher income range were concerned, few of these—excluding manual workers entitled to ophthalmic benefit notwithstanding their higher incomes—would come in during the next two years, by which time the general reorganization might be well on its way. Non-insured persons with an income below £250 might continue to be treated at the existing fee, plus 20% if thought desirable, and non-insured over £250 might be treated as private patients.

It was agreed to postpone further consideration of this matter until the next meeting of the committee, members meanwhile to consult their constituents, and also to watch the intentions of Parliament with regard to the Beveridge report.

A subcommittee was appointed to consider and collate schemes for the improvement of the National Eye Service with a view to the presentation of a set of proposals to the Medical Planning Commission.

Eye Examination in Factories

Some time ago a subcommittee was appointed jointly by the Group Committee and the N.O.T.B. on eyesight testing of employees in factories. This subcommittee now brought forward a series of recommendations with a view to obtaining the names of eye specialists who might be willing to undertake this industrial work. It was fully realized that not every doctor doing refraction work would be willing, or indeed could make it convenient, to do this work, which, in the subcommittee's view, should include not only individual examinations but also advice on all matters connected with vision problems at the factory. Nevertheless, it was thought that a sufficient number might be interested. One suggested way of proceeding was to approach medical officers of health for the names of doctors doing eye work in schools who might be willing to extend their activities to the factory. Other ways were also suggested, and, although some doubt was expressed in the Group Committee as to whether sufficient ophthalmic surgeons could be found for the work, it was agreed to proceed on the general lines of the recommendations, and the National Ophthalmic Treatment Board was requested to take such steps as are possible to institute this service.

H.M. Forces Appointments

ROYAL NAVY

H. F. Osmond to be Surg. Lieut.

ROYAL NAVAL VOLUNTEER RESERVE

Prob. Temp Surg Lieuts H T. Calvert, R J. L. MacBean, K. G. Marshall J. M. Taylor, M. H W. Holloway, T. M. C Roberts, and J. P H. Ogilvie to be Temp. Surg Lieuts
